An improvement in the Kirkgate Market, calculated to have a beneficial effect, has been projected by the Markets Committee of the Leeds Corporation. It is proposed, says the *Leeds Mercury*, to add a piece of ground comprising 1,054 square yards at the northern end of the Fish Market, and to cover it with a glass roof. The site of this extension, which has George Street on one side and East Lane on another, was, until a few months ago, occupied by fourteen small shops and dwellings, the clearing away of which has materially improved the sanitary state of the neighbourhood. The increase of the facilities for the sale and purchase of fish by this addition will be another distinct advantage, the accommodation of the existing Fish Market having for some time past been obviously insufficient. The most interesting part of the scheme, however, is that which provides for the covering of the ground. To find the kind of glass roof best adapted to the purpose, the committee have been at some pains. Inquiry and inspection have led them to adopt the plan carried out with a very satisfactory effect at the new Midland station, Bradford. This consists of a series of ridges and furrows, and lends itself admirably to the equal distribution of light and to good ventilation. It affords a further advantage, which weighed with the committee. It can be readily extended in any direction. The chairman of the Markets Committee (Alderman Hardwick) has, we believe, frequently urged the desirability of covering the whole of the open space in the market, and, as many of his colleagues admit, there is much to be said in favour of such an improvement. It need scarcely be said that in weather such as we have had of late, neither seller nor buyer finds the open square a very agreeable place, and it is computed that the revenue of the Corporation is 250*l.* a year less than it would be if there were protection from the rain. On a wet market day fewer of the vendors of the hundred and one different articles usually offered for sale take stands, and the receipts of those who brave the exposure are considerably less than under more favourable circumstances, inasmuch as there are fewer buyers. It is not suggested that a glass roof should be erected over the part occupied by the blocks of buildings where fruit and vegetables are chiefly sold, but that the avenues separating these should be covered. This would contribute in no small degree to the comfort of the public doing business in the market, but would to a corresponding degree enhance the value of the stores, and in some measure tend to increase the income from rents. There would then be no need for the verandahs to the stores, which at present prevent the convenient use of the upper rooms for storage purposes. The committee are about to ask the Council to grant 4,000*l.* for the increase of the accommodation for the sale of fish, this to include the cost of the glass roof on the ridge and furrow principle. That improvement will demonstrate what the advantages of covering the open ground would be. This, we understand, would entail an expenditure of about 16,000*l.*, and the covering of the avenues would cost about half that amount. Alderman Hardwick, who has carefully studied the matter, is strongly of opinion that the increase of revenue which such an improvement would bring would more than compensate for the outlay, whilst the utility of the market from the public point of view would be vastly greater.

GENERAL.

The Royal Scottish Academy opened the annual exhibition on Saturday, instead of as usual about the middle of the month of February. A leading feature of the exhibition is a fine display of works by the late Sir William Fettes Douglas. The works include 523 oil-paintings, 39 works in sculpture, and 269 water-colour and architectural drawings.

A Street in the Colombes, in the environs of Paris, is, by order of the Municipal Council, to be named after the late Théodule Ribot, the painter, who died there a few months ago.

"**The Choir of a Cathedral**" is the subject assigned this year by the Académie des Beaux-Arts for the Prix Achille Leclerc, which will be adjudged on February 27, 1892.

Mr. H. Hayter, C.E., has been invited to report to the Bray Commissioners on certain deviations from the specifications in carrying out the harbour works.

Mr. J. S. Simonds has been selected by the London County Council to fill the place of Sir E. M. Shaw as head of the London Fire Brigade.

The General Committee for the Aston Technical School have decided to select three architects to send in competitive sketch plans for their proposed technical school, instead of commissioning an architect for the job.

Canon Argles, of York, in connection with the St. Clement's Improvement Society, has given an address on the "Development of Gothic Architecture as seen in the Old Cathedrals and Abbeys of the Country."

A Business Supplement

The Contract Reporter.

to The Architect.

LONDON, JULY 3, 1891.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

CONTRACTS OPEN.

Engineer's estimate	396 2 0

IMPROVED

FLAT BRICK FIRE-PROOF FLOORS.

Transverse Section.

Longitudinal Section.

NO THRUST ON WALLS.

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with moulded projections protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known

The soffits of the bricks are specially prepared to key up the ceiling plaster. No laths or counter ceiling are necessary. They are not affected by water, acids, or alkalies, and they may be fixed during the progress of building, thus dispensing with the use of internal scaffolding.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost of a building with floors of this construction does not exceed that of one with the ordinary combustible timber floors of corresponding strength.

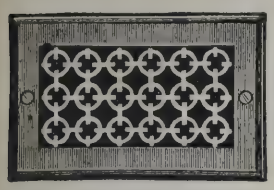
TRADE NOTES.

WE have pleasure in announcing that Messrs. C. Kite & Co., ventilating engineers, of Christopher Works, Chalton Street, London, have been entrusted with the ventilation of the new Council Chambers for the Orange Free State Government at Bloemfontein, South Africa, of which Mr. Lennox Canning (Messrs. Canning & Gould) is the architect.

THE new Board Schools, Carlisle, are being warmed and ventilated throughout by means of Shorland's patent warm-air ventilating Manchester grates and stoves, the same being supplied by Mr. E. H. Shorland, of Manchester.

WE are informed that Mr. Charles A. Smith, of the Athenæum, 71 Temple Row, Birmingham, has been appointed agent for Messrs. Woodhouse & Rawson United, Limited, for Birmingham and district, and has opened show-rooms at that address, where samples of goods may be seen as well as local orders executed from stock.



A NEW price list has been issued by Messrs. Webb & Son, of Comb Tannery, near Stowmarket. Messrs. Webb & Son, who have been awarded numerous medals at exhibitions, lately exhibited at the Royal Agricultural Society's Show at Doncaster, a collection of their leather machine bands, leather hose, fire buckets, lashing laces, strap butts, valve hides, English butts, calf skins, sheep leather, woolly leather, lambskins, &c. &c.

MESSRS. RICHARD SCHREIBER & Co., of 44 Gray's Inn Road, Holborn, W.C., are introducing their xylonite and paper-

stucco, which they claim is a capital substitute for the ordinary plasterwork, and is often preferred on account of its lightness, elegant appearance, correct execution and artistic design. These decorations can be affixed with common screws or thin wire-nails by any builder, carpenter or painter. The stucco decoration will not fall off. The first prize at Melbourne was awarded for this new decoration.

THE tender of Messrs. Martinson & Welton, builders, Bellingham, North Tyne, has been accepted for the addition of chancel to Falstone Church, North Tyne, under Messrs. Plummer & Burrell, architects, Newcastle-on-Tyne.

THE tender of Mr. John West, South Weston Road, Strood, Rochester, has been accepted for the re-erection of premises, 99 Eastgate, Rochester, for Messrs. Willis Bros., Mr. Walter Banks, of Rochester, being the architect.

THE tender of Messrs. J. Henshaw & Sons, of Liverpool, has been accepted for the extension of the Arnot Street School, at Walton-on-the-Hill, which is to be carried out under the direction of Mr. Edmund Kirby, of Liverpool, architect.

A MEETING of the members of the Potteries and Newcastle branch of the Amalgamated Society of Carpenters and Joiners has been held at Hanley. A knife-and-fork tea was provided at the Albion Hotel, and a meeting was afterwards held in the Temperance Hall. A resolution was passed, "That, in the interests of the society generally, it was desirable that members should exert themselves in getting fresh members to join the ranks."

THE following tenders have been accepted for grain and hay stores for Messrs. Clark Brothers, Palmerston Road, Aberdeen:—Masonwork, Greig & Craib; carpenterwork, Webster Brothers; slaterwork, George Davidson, jun.; plumberwork, A. G. Elmslie; painter and glazierwork, William Slater & Sons; ironwork, M'Kinnon & Co.

COMPLAINT has been made by the Education Department to the London School Board that the Charing Cross Road school, in the centre of a large population, is in a "disgraceful condition" in respect to sanitary matters. The school was a transferred one, and the Board is not primarily responsible for the drainage. Complaint is also made of the school buildings in Goodman's Yard, Minories, in the City division, also a transferred voluntary school, in place of which the Board is to build a new school. The Wandsworth District Board of Works having drawn attention to the state of the drains at the St. Andrew's Street Board School, Wandsworth Road, the assistant architect has surveyed them and reported the drainage to be in a "deplorable condition" from being ill laid.

THE complete public and private electric lighting of the town of Carlow has just been effected by means of water power situated at Milford, five miles distant. The electricity is brought into the town by overhead wires carried on poles placed along the towpath of the Barrow River, and it is distributed through $4\frac{3}{4}$ miles of the streets of Carlow.

THE *Aberdeen Press* says the plans of the new public library show an iron railing in front of the building. In view of the fact that the new Free South Church is fronted by a handsome white granite balustrade, and that at no very distant date the whole of the east side of Union Terrace will be similarly treated, it has been considered that the appearance of both buildings would be improved if a similar balustrade were erected in front of the library instead of the iron railing as designed.

THE contracts of Messrs. R. Aitkenhead & Son, masons; Mr. James Black, joiner; and Messrs. J. M'Lean & Co., plumbers and gasfitters, have been accepted for the reconstruction of the interior of the Gaelic parish church, Greenock.

AT the meeting of the Walsall Town Council the Mayor, in proposing the acceptance of tenders for the supply of 34,000 tons of gas coal, said that when the tenders first came in the committee thought that some of the prices were excessive. They declined to accept them, and, as the result of negotiations, first one and then another firm reduced their quotations, and the tenders before the meeting were 662*l.* 10*s.* less than the original ones, the figures being 23,212*l.* 10*s.*, as compared with 23,875*l.*

A SPECIAL meeting of the Cardiff Chamber of Commerce has been held for the purpose of considering the question of dock accommodation. Mr. John Gunn presided. It was unanimously felt that increased dock accommodation should be provided without delay, and a deputation to the Cardiff County Council was appointed.

AT the meeting of the Edinburgh and Leith Gas Commissioners it was stated that during the year they had made at their own works 1,373 million cubic feet of gas, as compared with 1,273 million cubic feet last year.

THE Maidstone Local Board of Health at their meeting accepted tenders for supply of stone for the roads. Among those accepted was that of Mr. James Runnalls, of Penzance, for 2,195 tons of Penlee elvan granite at 9*s.* 6*d.* Alderman Long said the Highways Committee recommended the purchase

BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our DESIGNS, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, J. H. PICKUP & CO.

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE
LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.
Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.
Price, £1 10s. and upwards Portable Filters on this System, £1 5s. to £3.
Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4*s.* 6*d.* and 6*s.* each. Household and Fancy Filters, from 10*s.* Water-Testing Apparatus for detecting Impurities in Water, 10*s.* 6*d.* and 21*s.* each.
157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

Portable Cistern Filters

Reading Cases for the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

of Penlee granite, which was the same as they had had for a great many years in the town. The only object of the committee was to get the best stone they possibly could for the money; and when they remembered that the crushing strength of Penlee granite was 29,000 lbs. per square inch, and that of Guernsey granite 15,000 lbs., they would not be in doubt as to which was the best stone.

VARIETIES.

DURING a thunderstorm on the 25th ult. the roof of Doveridge Church, near Uttoxeter, was set on fire, but, fortunately, extinguished before serious damage was done. It seems the lightning struck the vane and detached the upper portion, and then ran down the conductor and along the bottom of the roof, bursting the gaspipe and igniting the gas.

THE Town Hall at Leek was also struck by lightning, the conductor safely carrying the electricity to the ground. Where the conductor entered the ground a waterpipe was fused, and the water burst up through the pavement. The whole of the building was shaken by the force of the blow.

AT Liverpool the spire of St. Saviour's Church Schools was struck by lightning. There were about seven hundred children and a number of teachers in the building, and the shock was so great that the school trembled to its foundations. St. Paul's Church, situated in the business portion of Liverpool, was struck by lightning and the dome set on fire. Fortunately the firemen prevented much damage to the edifice.

NEGOTIATIONS are in progress between the Middlesex and Surrey County Councils with a view to rebuilding Kew Bridge. The present bridge is only 24 feet wide and exceedingly steep. The idea is to build a new structure of stone, with five instead of seven arches, in the style of the present bridge, 44 feet wide. The roadway to be 28 feet and the footpaths 8 feet in width.

A MEETING of the chairmen and clerks of all the School Boards of North Staffordshire has been held at Stoke, when it was proposed to resuscitate the scheme for the establishment of a joint truant school for the district. It was resolved to form a joint committee consisting of two members and the clerk of each Board to decide upon the best plan of carrying the scheme into effect.

AT Edinburgh a committee of the Town Council lately visited the Fettes estate, where a piece of ground extending to an acre and three-quarters has been offered to the city by Dr. Rowand Anderson, architect, on behalf of the Roughhead Trustees, on condition that a couple of foot-bridges are erected across the Water of Leith near this point. The cost of the bridges is set down at 600*l.* or 750*l.*, and it is said that the acquisition of the ground by the city would be a desirable step.

A BILL promoted by the Manchester Town Council has come before a Committee of the House of Commons. The Bill gives power to the Council to establish a "thrift" scheme, to deal with advertisements on walls and "sky-signs," to sell water for hydraulic power, and provisions as to streets and buildings, drains, music and dancing licenses, and other matters which affected the improvement of the general health, &c., of the city.

AT Stratford-on-Avon a conference has taken place between members of the Town Council and the rural sanitary authority on the question of providing a joint sanatorium for the two authorities.

AT the meeting of the Tamworth Rural Sanitary Authority it was decided to apply to the Local Government Board for authority to expend a sum of money, not exceeding 250*l.*, in sinking and boring near Kingsbury Wood in the permian, in order to discover, if possible, a water supply for the Kingsbury parish.

IT is proposed to utilise the water of the river Isar for lighting Munich by electricity. The details of the project have been worked out by Herr Oskar von Miller, electrical engineer, and technical manager of the Frankfort Exhibition.

A BILL has been introduced by Mr. Balfour for the reimbursement to training colleges in Ireland of certain past expenditure on their sites, buildings, appurtenances, premises and fixtures.

THE members of the Glasgow Town Council have made the annual inspection of the Loch Katrine waterworks. When the new undertakings in course of formation are completed, the supply of water to the city will be increased by 70 million gallons per day, which, along with the present delivery—42 million gallons—will bring the total available supply up to 112 million gallons per day. Craigmaddie reservoir, which is being constructed, is much larger than that of Mugdock. It will have a water surface of 86¼ acres, and will contain 700 million gallons, being a supply at 40 million gallons per day for 18 days, in addition to the 12¼ days' supply the present Mugdock reservoir contains. The inlet and outlet works will

be so arranged that either or both reservoirs may be used for the supply of the city. A water-tight bottom has now been reached, and the trench is being refilled with puddle over a length of 2,800 feet. Including the Barrochan property, the extent of the land purchased for this reservoir is 215½ acres.

IN connection with the proposed sewerage of Writtle, Dr. Thresh, the medical officer of health to the Chelmsford Rural Sanitary Authority, has reported that, with Mr. Smith, he lately visited the Acton Sewage Works, and examined the Polarite filter beds in use, with a view to ascertain whether the process could be rendered applicable for the treatment of the sewage of Writtle. Everything they saw and heard bore out all they had been led to expect from the process. The filter beds were very small, yet they filtered rapidly, and had for years retained apparently unchanged their purifying powers. The effluent produced seemed to be quite satisfactory. As a result of the visit they were decidedly of opinion that the Writtle sewage could be satisfactorily treated by precipitation in tanks and final filtration through a few square yards of sand and Polarite filter.

BUILDING AND BUILDERS.

THE foundation-stone of a public hall for Corstorphine has been laid. The plans, which have been prepared by Mr. J. Robert Pearson, architect, Edinburgh, provide for a hall with dome-shaped recess or platform, capable of accommodating 460 people. Behind the hall are two retiring-rooms, and above these a caretaker's house. In front of the main building is a double storey, in a plain Scottish style. On the ground-floor, to the right of the chief entrance, is a committee-room, and to the left a cloakroom, the space overhead being occupied as a lecture-room, which may be used as a library and reading-room. The dressings are of red stone and the walls of natural faced blue Hailes stone.

PLANS for the extension of the Longmore Hospital for Incurables have been passed by the Edinburgh Dean of Guild Court. The proposed work consists mainly of an extension eastwards, 40 feet parallel to Salisbury Place, and running back as a wing northwards to the length of about 120 feet, but considerable alterations will be made in the centre block of the present building and the wing behind it. The accommodation in the present building, including that in the adjoining houses which are to be taken down, provides about sixty beds; whereas when the new buildings are completed, the accommodation will be for about a hundred beds, in addition to the servants' rooms and those of the nurses and probationers, who are to be in the upper floor of the present centre block after it has been re-arranged. The cost is expected to be between 7,000*l.* and 8,000*l.* The architects are Messrs. Kinnear & Peddie.

ON Monday afternoon a meeting of master builders was held at Bedford Street, Holborn, "to protest against the manner in which the School Board for London deals with their work, bills and payments." Mr. Dove was in the chair, and other firms represented included Atherton & Latta, Dearing & Son, Charteris, Cubitt, Seeley, Lathey, &c. The meeting, it was explained, had been called because of the builders being so badly treated that some of them had refused to do further work for the Board under present arrangements. They not only, it was said, had their bills shamefully cut down, but had to threaten legal proceedings before they could get their money. One builder stated, as an instance, that the Board at one time owed him nearly 500*l.*, and, in response to an application for a settlement, a cheque was sent for 3*l.* 17*s.* 5*d.* The system adopted by the School Board for their repairing accounts and schedule prices was declared to be one that was worrying to the builder, and also one that must necessitate an increased staff of clerks at the central offices of the Board to check the Bills. The builders had to insert every item of repairs, such as "one screw, ½*d.*," "three yards of cord, 2*d.*," and so on, leading to extra cost in the builders' offices as well. The system had become so intolerable and the periods of payment so extended, that the builders had tacitly agreed not to work under present arrangements. Mr. Cook, a member of the School Board, sent a promise to the meeting to introduce a deputation to the School Board, and this offer was accepted.

THE *Aberdeen Press*, referring to the proposal which has been mooted in Town Council circles of erecting new municipal buildings for the city, says the matter the other day came up at a meeting of the magistrates. The question arose in connection with another subject which was before the bailies, and went as far as a discussion on the best site for the new structure.

THE infants' school at Upper Stratton, near Swindon, is about to be enlarged by the Stratton St. Margaret School Board at a cost of 750*l.* Mr. H. Looker, of Stratton, will carry out the works, from the designs and under the superintendence of Messrs. William Drew, M.S.A., & Son, of Swindon.

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

THE church of Ormskirk has been restored at a cost of 17,000*l.* It is one of the most interesting churches in the country, dating from 1080. It has a Derby chapel, which for 300 years has been the burial-place of the Earls of Derby. The church has a massive tower and spire, standing side by side, and in that respect is unique in England.

AMERICAN NOTES.

THE New York *Builder and Woodworker* says :—The radical plan adopted in London of providing decent homes for the decent poor seems to have attained so much of success that no working man will be compelled to live in such filthy, malodorous dens as thousands of Englishmen and Americans have been doomed to occupy. The condition of New York is fully as bad as London, and is steadily growing worse. The success of the plan adopted in London points the way to the relief of New York.

THE Chicago *Journal of Commerce* reports Judge Gresham's description of the court-house as follows :—I think it is positively dangerous to remain in this part of the building. The ceilings have bulged so as to break the water-pipes, and as a result the air is contaminated, foul gases generated and I believe it is affecting my health. It would be dangerous for a well man to occupy these rooms. Just look at those cracks. There is a fissure an inch wide at the side of the fireplace that has opened within the last three months and another at the doorway of my room nearly an inch wide, and that has appeared within the last few weeks. The workmen come around here occasionally and putty up the cracks, but that's all the good it does. I'm getting entirely out of patience over the situation.

THE Owana, Mich., *Times* says :—The three-storey factory building of the D. M. Estey Furniture Company, size 256 feet by 80 feet, was erected in five and three-quarter days, and the machinery put in and at work six days later. The building required in its construction sixty car-loads of lumber and 170,000 feet of flooring, and the machinery is run by a 250 horse-power engine.

THE output of sandstone in the United States in 1889, according to a bulletin issued by the Department of the Interior, Washington, was 71,571,054 cubic feet, valued at 10,816,057 dols., while for 1880 the value was only 4,780,391 dols., an increase during the decade of 6,035,666 dols., or 126·26 per cent. There were 16,925 workmen employed, to whom were paid in wages 6,257,580 dols. The total expense of producing sandstone in 1889 was 8,130,295 dols., and the total capital invested 17,776,467 dols., of which 11,501,100 dols. was invested in land. A table showing the relative standing of productive States is given according to the tenth and eleventh censuses. It is evident from this that, while eighteen States only were productive in 1880, the number has now reached forty. Ohio holds first place in both. At the tenth census New York held second place, but bluestone is included in the figures given for value of output. At the present time New York holds fifth place, and the apparent decline is due to the exclusion of bluestone. According to the eleventh census Colorado holds third place, while ten years ago it held sixteenth place among the productive States. The vast increase in the sandstone production of this State, namely, from 9,000 dols. to 1,224,098 dols., is due largely to the operations of the Union Pacific Railway Company. Enormous shipments of sandstone are now made from Colorado to remote parts of the United States, and the business is in a most flourishing condition. Another notable change is the appearance of California as a productive State, holding eleventh place. This State does not appear among the eighteen States of the tenth census. It is evident that the increase in production during the last ten years amounted to 6,035,666 dols., or 126·26 per cent. The eighteen States which were productive in both census years produced sandstone in 1889 to the value of 10,068,475 dols., or 93·09 per cent. of the entire product, not, however, including bluestone. The twenty-two new States produced to the value of 747,582 dols. in 1889, or 6·91 per cent. of the total amount. It is thus apparent that although the number of States producing sandstone is now more than twice as great as in 1880, nearly the entire output comes from the same States that were productive ten years ago. It is evident that in both censuses the North Atlantic division was the most productive, the North Central division following closely in value of production. The Western division stands third for the eleventh census, with a product amounting to 1,781,539 dols., while the third position for the tenth census is occupied by the South Atlantic division. Fourth place for the eleventh census is filled by the South Central division, in which at the tenth census no sandstone was produced. Fifth place for the eleventh census is occupied by the South Atlantic division, which produced only a small amount ten years ago. The great bulk of the sandstone production comes, therefore, at

D

present from the North Atlantic and North Central divisions, the South Atlantic and the South Central producing very little in comparison, while the Western division shows the enormous increase in ten years from 11,000 dols. to 1,781,539 dols. From the grand total for the United States, it appears that 71,571,054 cubic feet of sandstone, having a total value of 10,816,057 dols., were produced by 16,925 workmen from 803 quarries. To this number of men 6,257,580 dols. were paid in wages. The total expense of producing the entire amount of sandstone is 8,130,295 dols., thus indicating a profit to the producers of 2,685,762 dols. The total capital invested is 17,726,467 dols., of which 11,401,100 dols. is vested in land. It appears that 7,121,942 dols. worth of stone is applied to building purposes, while 1,831,822 dols. worth has been applied to street work. Abrasive purposes have consumed an amount valued at 582,229 dols., while for bridge, dam and railroad work 1,021,920 dols. worth was used. For miscellaneous purposes the amount is 259,144 dols. Although the value of the stone for abrasive purposes is comparatively small, it is important to note that the quality of the stone applied to these purposes is necessarily very fine, and consequently has a decidedly higher average value per cubic foot than that used for any other purpose.

SANITATION.

SANITARY engineering is in the ascendant. There is a general desire to secure the very best methods of domestic sanitation, as evidenced by the crowd of architects, sanitary specialists, &c., who accepted the invitation of Messrs. John Bolding & Sons to inspect their new premises, Grosvenor Works, Davies Street, Oxford Street. The prominent position of this firm is well known ; a flattering testimony is that, after occupying an old-fashioned place in South Molton Street for seventy years, they have found it necessary to build these immense new works to contend with the increased demand. Tuesday, June 30, the day of its opening, must, therefore, be marked a red-letter day not only for Messrs. John Bolding & Sons, but for their clients, to whom better facilities for selecting their goods are here given in this roomy, convenient depôt. Mr. Bolding was present to show his visitors all over the fine building, and the architects responsible for it, Messrs. Wimperis & Arber, explained the details of the structure to an audience strongly prejudiced in its favour. It will be no digression to say that Messrs. Bolding & Sons recommence business in, perhaps, as fine works, warehouse and show-rooms as has ever been provided for the purpose, occupying six floors, and arranged to accommodate show-rooms on the first three floors and workrooms on the remainder. This brings every department under one roof, except the brass, which is at 304 Euston Road. All the work is done on the premises, and under the immediate supervision of those responsible for its finish and excellence. Thus the sixth floor is occupied by the marble masons, who prepare the highly-finished lavatories, baths, &c., and the fifth and fourth floors by the engineering department, brass fitting, &c. The firm have certainly shown that they practise what they preach by transforming the ordinary gloom of a workshop into a bright, sunny, airy, comfortable room, that would satisfy an artist. The top floors communicate with showroom basements by means of a large lift. An iron staircase fire-escape is accessible from every floor, and the whole building is fireproof. The buyer who could not find his requirement in these showrooms would, indeed, be incorrigible. First of all, the things are arranged in such an attractive manner, thanks to the manager, Mr. Hart. All the different patterns of closets, for instance, some hundreds, are placed side by side, and as the water is connected, a practical illustration of the merits of each is given. The "Simplex" and the "Kenon" are the two best known, and are in universal use. We particularly noticed the advantage of the porcelain lining, which insures perfect cleanliness. The same system of arrangement with the baths, different sorts and sizes grouped together, at prices to suit "all sorts and conditions of men," and it is surprising to see how cheap some of these luxuries are—a porcelain lined bath, for instance, with shower fittings attached, for 8*l.* 15*s.* The most noticeable feature in all these goods is the perfect finish, such that one seldom sees in such work. The cabinetwork and the selection of marbles to match leaves no room for criticism. The different kinds of urinals are placed together—automatic, treadle and otherwise ; whilst the patent "Simplex" disconnector, one of the latest improvements, meets with a good deal of favour. A small department is devoted to electric light fittings, &c. The inspection gave every satisfaction to the visitors. Messrs. Wimperis & Arber were praised for the design by architects themselves, whilst Mr. Bolding received congratulations on all sides. It was altogether a day of good wishes and bright prospects. We cordially share in the anticipations. Luncheon was subsequently served in the adjoining drill-hall, Mr. Bolding presiding. Mr. Pluknett (late of Messrs. Cubitt & Co.) proposed the health and prosperity of the firm in a short speech, in which

LONDON, E.C.

PATENT No. 2496. A.D. 1884.

he expressed the pleasure the inspection of the works had given him, and alluded to his long experience of the quality of the firm's work, with which he was always satisfied. The toast was honoured with "three times three." Mr. Bolding, in a neat little speech, expressed his gratitude for the kind expressions of good feeling towards him. The object of the firm had been only to do the best work, and he had been greatly assisted in this object by an able staff, who had been brought up in the business and knew every requirement. With his workmen generally he was in the most perfect accord. In some instances he had in his employ three generations in one family—boy, father and grandfather. In conclusion, he had built the new works to be in advance of the times, and he intended to do his best to please his clients. Mr. Arber, responding to repeated calls for "The Architects," thanked the company on behalf of Mr. Wimperis and himself for the appreciation their work had met with, and hoped the business of Messrs. John Bolding & Sons would increase so rapidly that a further extension would be necessary. We unite in wishing the firm a new era of deserved success.

FIREPROOF ROOF CONSTRUCTION.*

ROOF construction of a building is a very important point of fireproof construction, this being the access of fire from above, caused by sparks and flames of any burning neighbouring structure. The cheapest and best fireproof construction that can be obtained is gained by the use of T iron and book tile. T irons should be regularly spaced at 18-inch centres, following outline of slopes in roof which is given by the change of level of roof beams upon which T irons rest. These T's should be held in position with iron clamps to roof beams. Two and one-half inch or 3-inch T's are generally used for this mode of construction. The size of the T iron governs the size of the book tile that has to be laid between them. If 2½-inch T's are used, 2½-inch tile must be used. This will bring the top of the tile about ⅜ of an inch over the edge of the stem of the T. The name of book tile is given this tile, owing to its shape which is like a book. Good tight joints are obtained by using this tile, as one tile fits in the other, which does away with a vertical joint, which in no case should be allowed on a roof. All tiles should be bedded in mortar and all joints along T's should be slushed up, leaving an entire smooth surface. If a concrete is desired on this roof, upon which tarred paper and gravel is to be laid, it should never be composed of either cinders or crushed stone mixed with sand and cement and water. This is a glaring error which is quite frequently indulged in. No matter how hard you try to get an even surface, you will always find a cinder or stone here and there sticking up, which cuts through the tarred paper, and if walked upon injures the roof. A concrete composed of sand and cement will answer first for this purpose. I cannot see why it is that a concrete is at all necessary. It is better for the roofer and cheaper to apply the tarred paper direct on the tile, using a ply or two more of tarred paper. The cost of same is amply made up by omitting concrete. These remarks applied to flat roofs. Where roofs have a rake not over 45 degrees a similar construction (as aforementioned) regarding tile work can be followed. If rake or roof is any steeper, each tile should be either wired or bolted to T-irons. This is especially necessary when a part of the roof drops off to a vertical line. One or two-ply of tarred paper should cover these roofs before slates or roof tile are nailed to them. Roofs that are to be used as promenade decks require a stronger construction; regular floor arches are required here. Trusses that support roofs or carry additional loads should be thoroughly fireproof, as this is a vital point of fireproof construction. If this is not done it exposes the steel and iron to the heat of a fire that may start below them; consequently a grave danger threatens the destruction of the trusses and whatever they may support. This construction occurs mostly in theatres and large halls. If lower chords of trusses carry a floor, or, in other words, the ceiling of the auditorium, the entire truss should be fireproofed, no matter if it is cut off from below by this floor or ceiling. If truss is so designed that lower chords show below ceiling-line, they should have especial attention as regards fireproofing.

Suspended ceilings are only used to shut off the roof construction from view, and to give a level ceiling, therefore this construction is very light. Hangers are suspended from the roof-beams, to which T-irons, say 3 inches times 3 inches, are attached; spacing latter about 5 feet centres. On these, at right angles to the direction they take, 1-inch T-irons are spaced 12-inch centres. Between the 1-inch 's a light tile is set, to which plastering is applied from below. The general construction of to-day, in our modern fireproof buildings, is to make the ceiling of the last storey as strong as a regular floor. This is

FIG. 1/11.—Patent "Waste Not" Clear Way Valve Closet; Weir Overflow Basin, Flushed each Action; Parallel Pull.

Patent "COLUMN" Closet, with *Lead* Trap. This insures the joint between the Closet and Soil-pipe being well made. The seat can rest direct upon the earthenware.

Certificate of Merit, Health Exhibition, Brighton, 1890.

THESE ONLY Closets which received Certificates at the Brighton Exhibition.

done to afford ample storage space and still more important space for pipes, tanks and machinery.

Furring of the inside of outside walls with hollow tile is the most thorough preventative against moisture penetrating through a wall. Each tile should be carefully, regularly set. The thickness of tiles used for this purpose are 1½ inch and 2 inches thick. You can therefore see that they depend a great deal on the condition of the wall to which they are to be applied. These walls should be as plumb on the inside as they are on the outside. The use of wood for this purpose should not be allowed, as it is not fireproof or moisture proof. Moisture will affect wood so that dark discolorations will appear on plaster, every lath and strip being clearly shown. Corrugated iron laths and wire lathing are also applied to these walls, but also show the defect of this construction as wood laths. Hollow air spaces are sometimes built in walls to overcome this defect, but that is too expensive a construction and takes more room for walls. The use of porous bricks is the best construction for this purpose. The good qualities of this material have been mentioned before.

Skylight curbs should be built from ceiling-line of last storey, or attic floor, through roof. This is a very important feature of a fireproof structure. No windows should be called for in these curbs. Any light that is necessary for attic should either come direct through roof or through outside walls. These curbs are generally called for to be built of hard glazed tile laid in pure cement mortar, and all joints to be neatly struck. This is supposed to constitute the finish of this part of the work. This construction may look very nice, but it is not fireproof. It is in a dangerous locality, as the draft of any fire that may occur in the storey below will invariably be carried up in this direction, owing to the ventilators in the skylight above. Heat and water will splinter this wall in a very short time. Consequently flames and smoke will have access to the exposed roof construction, water tanks, machinery, vent flues, steam and water-pipes, &c., which are located in this part of the building, and will cause dire ruin and paralyse the machinery and sanitary fixtures of the entire building. These skylight curbs should, therefore, be built of a material that will withstand the combined attack of fire and water.

Elevator pockets should be built in every elevator, in order to shut off any smell, flames or smoke that may arise from defective machinery or sanitary arrangements in basement, as a tremendous draught is always rushing up these shafts. This would not be very pleasant or healthy for the occupants of the building. I would even cut off the useful freight elevator from running down to basement, if a partition, which would stop this draught, were not built around same in basement. Such a partition should be set back from elevator, allowing ample room to load and unload freight from same. Elevator pockets should be built as follows :—T iron should be suspended below first floor on hangers about 18 inches or 2 feet below floor beams, spacing T's 18-inch centres and setting book tile between same. Walls of pockets should be built of 3-inch partition tile. Stairs that start from basement and run up to roof should also be cut off from rest of basement by a similar partition as mentioned about freight elevator. Also for similar reasons.

Especial attention should be paid to see that all beams in pipe-shaft which enclose cylinders of elevators and pipes are thoroughly covered, making due allowance in the framing of your ironwork that sufficient space is given to allow of one continuous line of tile. One of these shafts, should a fire get into it, would act like a huge chimney. All beams in elevator shaft and stair wells should be covered. If ornamental iron fascias are called for on these beams, then the construction of same should be so designed that the iron contractor is not obliged to knock off fireproofing in order to connect his work to floor beams. The fireproofing of the beams, to which guides are attached, should never be done until guides are in place.

Raised floors for water-closets are used when the construction of a building is of such a nature as not to admit of enough space or room to carry pipes in a distinct and separate passage. These floors are built of either book tile and partition tile or book tile, partition tile and T irons. When book tile and partition tile are used, partition tile are built in rows, about 18-inch centres, to any height upon which book tile are set. If T irons are used in addition to these tiles, partition tile are spaced in rows about 5-feet centres, upon which 'sa re set at 18-inch centres for book tile, which is to be set on T's. This will admit of ample space for all pipes below floor.

Framing of iron construction is a very important feature regarding fireproofing—flat-arch construction. All beams should be spaced as regularly as possible. All lower flanges of beams must be on a level line. If beams are all to be level on top, they must be necessarily the same size. Channels or flat bars must be built in walls to receive skewbacks. Flat bars are preferable to channels and are cheaper. Tie rods should be spaced not more than 6 feet apart, for framing around stair wells and light shafts ; tie rods should be spaced not more than

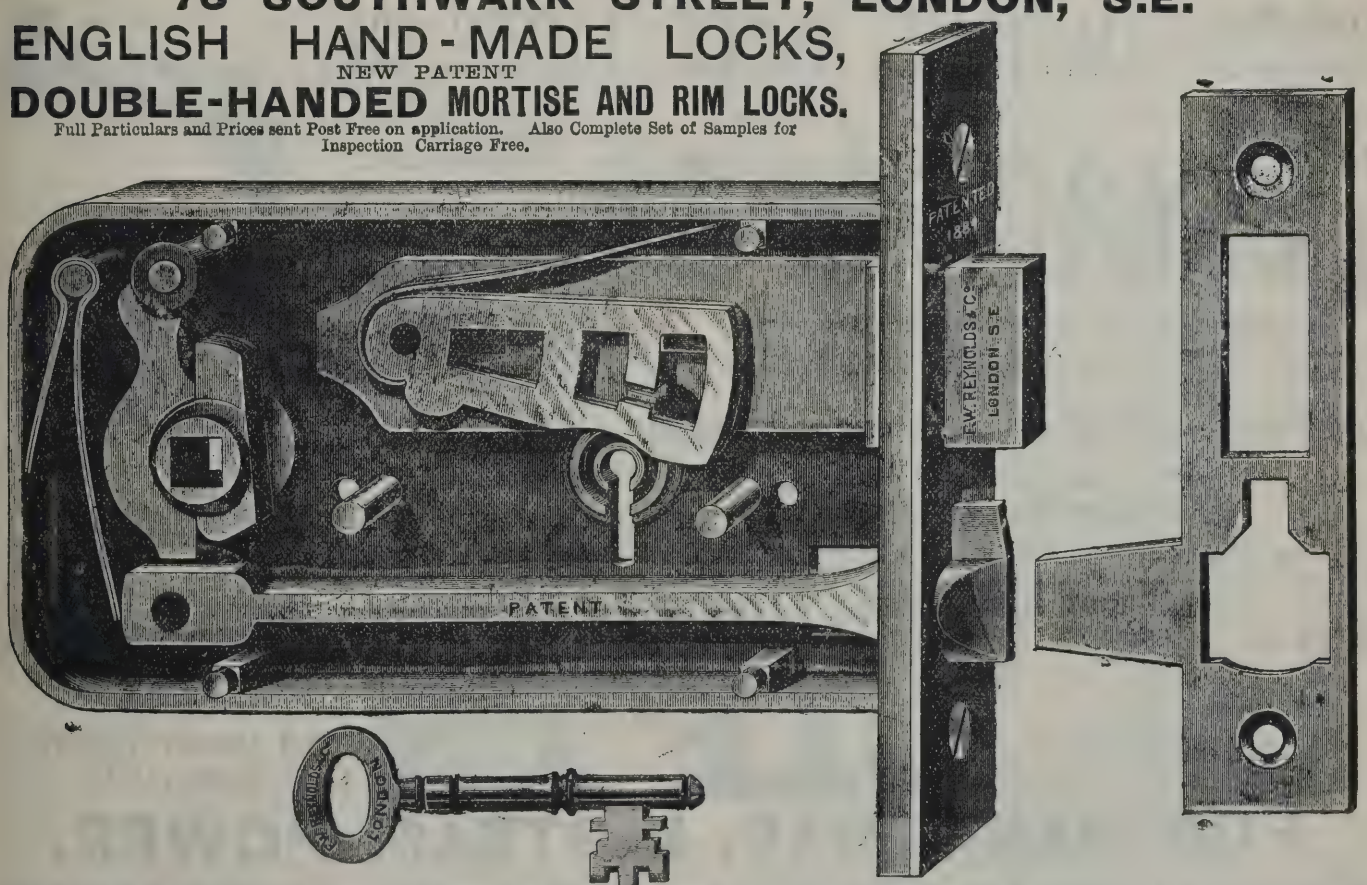
5 feet apart. If a 15-inch beam is used and a 9-inch arch is to be built between them, tie-rods should be put in 4½ inches from bottom or lower flange, or beam will be tipped over. This is especially dangerous at well holes. If a 9-inch I and a 9-inch arch are used, tie-rods should be placed in centre of beam. For like construction of different sizes of material, a similar proportion of location of tie-rods is necessary. All pipe-shafts, dumb elevators, vents and fireplaces should have iron framework around them. I beams should be used instead of channels for this purpose, as fireproofing can be more securely fastened around them. If a 20-inch girder is level on top with a 9-inch beam, then angles should be rivetted to web of 20-inch girder 9 inches from top flange. The levels of all lintels in relation to floor lines and wood finish, should be carefully studied, raising same enough to allow ample room to apply fireproofing. This will vary at every step from 1 inch to 2½ inches, according to width of lintel. In complicated framing especial attention should be given if fireproofer can apply his fireproofing after everything is framed together. Cases turn up every now and then where it is an impossibility to cover a certain vital point, after all framework is in place, which should have been put in at the same time it was framed together.



Ample sections and levels should be shown on each plan. Proper allowance for sizes of all well holes and elevator shafts should be made. It should be borne in mind that at least 1 inch should be allowed over edge of I beam at these openings for fireproofing. To this you have to make allowances for ornamental iron fascias, &c. Roof beams should be securely tied together with tie rods. This is especially necessary when beams are carried on walls, the weight of parapet and firewalls being in many instances too light and weak to stand the thrust of a series of arches. Anchors and plates should be used quite freely if you have a similar construction. These remarks apply to roofs where arches are used. If floor beams are carried on an iron skeleton which is built in walls, a similar construction is advisable when you get up as high as the attic floors and roofs. When bolts are used for connecting one beam to another, the threads of same should finish flush with the head of the nut, or should be turned around, leaving head of nut on outside. This is imperatively necessary ; if it is not done, most of the skewback or butt has to be cut to pieces as a square bearing is necessary. This will naturally weaken the entire arch.

T irons for roof construction should be spaced regularly. Odd spaces to be worked over next to walls. T's should also be securely fastened to roof beams with clamps. Ceiling should be spaced similar to roof T's. Clamps are not necessary. Spacing of 's for bay construction should be carefully looked after. Odd spaces should always be worked over to end walls. If cantilever brackets occur a similar spacing should be followed, leaving odd space against bracket. Complete sections should be given of this work for every floor if there is any change of levels, showing if T's are bent over flanges of beams or rest direct on them, also showing whether you want a level ceiling or not. If cantilever brackets frame into a plate girder from one side and floor beams from another side, and a level ceiling is required, then rivetheads in lower flanges of girder should be countersunk. Ample room should be given around columns for fireproofing, so that a whole block of tile at least 3 inches thick can be built up independent of clamps or wire. In no instance should the fireproofing around the column be omitted for the sake of lack of room to case same with marble. If all these points would receive a little more attention, many hours of bother and worry would be spared to the party who is designing a building where such construction occurs. All these items should be carefully shown on plans, and superintendents should see that they are carried out as shown.

Plans and specifications for fireproofing should clearly and distinctly specify what is required. Details and section, &c., should be shown of everything required. It is simply appalling to read some of the specifications of this work that are written nowadays. Everything is left for the fireproofer to ferret out as best he can. This is entirely wrong, as it shows either a lack of knowledge of this important branch of building construction or disgraceful carelessness. Each and every different piece of work should be itemised, noting in what storeys each kind of work is wanted and sizes of material required. A new specification must be written for every new building, as it is impossible to expect a standard or office specification to hold good regarding construction of work, owing to great variations in design. They are at the same time confusing and misleading, causing an endless amount of bother.

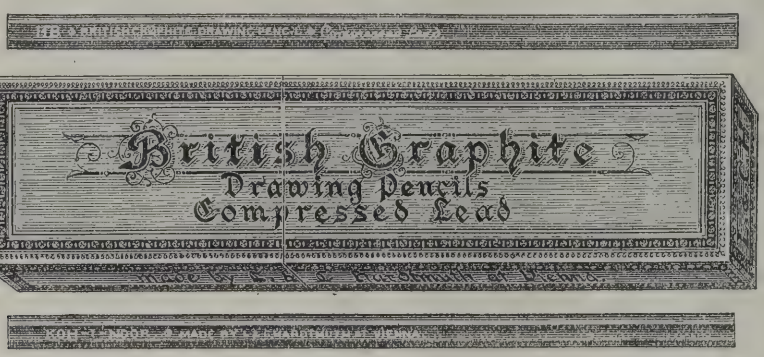
Iron contractor should furnish every piece of iron construction regarding framing work. Small T irons and clamps under lintels should be furnished by fireproofer. All holes for pipes through floors and partitions, &c., should be bored by plumber, gas or steam-fitter. Plasterer should replace all tiles he has displaced during his work. And finally, one and all contractors

F. W. REYNOLDS & CO.
73 SOUTHWARK STREET, LONDON, S.E.
ENGLISH HAND-MADE LOCKS,
NEW PATENT
DOUBLE-HANDED MORTISE AND RIM LOCKS.
Full Particulars and Prices sent Post Free on application. Also Complete Set of Samples for Inspection Carriage Free.

Now Ready, F. W. REYNOLDS & CO.'S New 387-page ARCHITECT'S ILLUSTRATED CATALOGUE of Kitcheners, Stoves, Chimney-pieces, Tilework, Locks, Brassfoundry, Stable Fittings, Sanitary Goods, &c. Handsomely Bound in Cloth, and containing above 1,500 Illustrations. *A Copy will be sent Post Free on receipt of card.*

should be held responsible for any damage to work of another contractor, any cost of replacing such work to be charged to him and taken out of his final payment. It will be found that, by making such rulings as just mentioned, you will not be continually called upon to settle clashes that occur between contractors and owners of buildings.

For heights of long partitions that are not braced or bonded into any cross partitions, the following rules regarding thickness of partitions should be followed :—Three-inch partition, 12 feet high; 3½-inch partition, 13 feet high; 4-inch partition, 14 feet 6 inches high; 5-inch partition, 17 feet 6 inches high; 6-inch partition, 20 feet high; 8-inch partition, 25 feet high.



Partitions can be built a great deal higher, but have to be built in such a manner that a space is left between, which is governed by the height desired. This, of course, necessitates two rows of tile, or double partition, as lateral stiffness is what you have to look out for. Smoke stacks and elevator shafts can be built to any height desired if the proper sized tiles are selected.

For spans of flat floor arches, the following sized spans should be used. These spans are the extreme limit which is to be allowed. Six-inch arch, 5 feet; 7-inch arch, 5 feet 6 inches; 8-inch arch, 6 feet; 9-inch arch, 6 feet 6 inches; 10-inch arch, 7 feet; 12-inch arch, 7 feet 6 inches. The spacing of beams should not be governed by any sized span given to you, but should be governed by the load that is to be applied on beams. If it is found that strength of beams is sufficient for such spans, that settles all questions regarding same.

If fireproofers are called on to estimate on any work where iron construction is used, they require both iron and general diagram.

NEW CATALOGUES.

WE have received samples of drawing materials from Messrs. L. & C. Hardtmuth, of Golden Lane, Barbican, E.C., and Vienna. Among the pencils is the Koh-i-Noor new hexagon drawing pencil named British graphite, made in 12 degrees from 6B to 6H. Messrs. Hardtmuth say of it :—"After many years of experimenting with the various graphites of the world, we are able to lay before the public a pencil that is without question immeasurably superior to anything that has hitherto been produced, both regarding its erasing and its delightful smooth writing qualities. The many testimonials which we are now receiving regarding it prove that it has already secured the approval of many who are able to judge." There are also new school and office pencils, a new spiral programme pencil, and the artist's safety pencil. The drawing pins are of an improved kind, and an extractor is furnished with them. In conclusion we may add that, having tried Messrs. Hardtmuth's new Koh-i-Noor pencils, we can confidently recommend them to architects, engineers, draughtsmen, &c.; we have failed to discover any grit, neither have we had any difficulty in erasing. Messrs. Hardtmuth's name as pencil manufacturers is so well known that further comment is unnecessary.

PROPOSED AMERICAN BUILDING LAW.

A COMMITTEE of delegates from the American Institute of Architects, the National Association of Master Builders, the National Association of Building Inspectors, the National Board of Underwriters and the National Association of Fire Engineers have recommended the following as the essential points for a building law :—

1. That all buildings over 70 feet in height be constructed throughout of incombustible materials, protected in the most approved manner for resisting fire.

2. That interior structural ironwork in all buildings be covered and protected by fireproof material.

3. That all buildings over 50 feet in height be furnished with permanent standpipes and ladders for the assistance of the Fire Department.

4. That the height of buildings to be erected should not be more than two and one-half times the width of the principal street on which they are situated, and that no building or portion of a building, except church spires, should be more than 125 feet high, except under a special permit.

5. That the open floor-space, not divided by walls of brick or other combustible material, in all buildings hereafter erected for mercantile or for manufacturing purposes, should not exceed 6,000 square feet, without special permission, based upon unusual and satisfactory precautions.

6. That every building to be erected, which shall be three storeys high or more, except dwelling-houses for one family, and which shall cover an area of more than 2,500 square feet, should be provided with incombustible staircases, enclosed in brick walls, at the rate of one such staircase for every 2,500 square feet in area of ground covered.

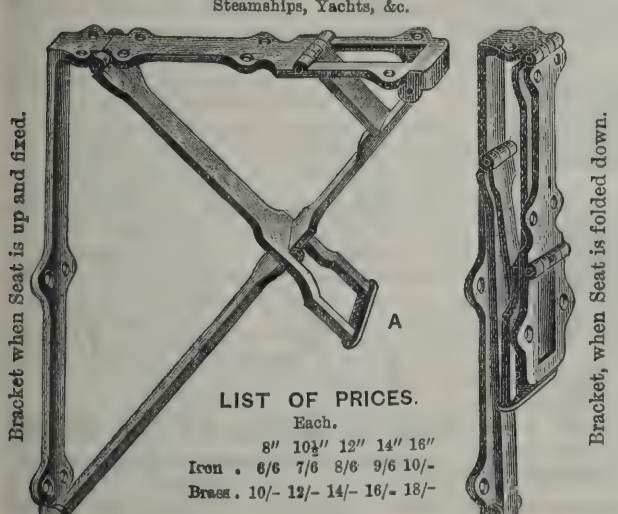
7. That wooden buildings, erected within 18 inches of the line between the lot on which they stand and the adjoining property, should have the walls next to the adjoining property of brick, or, when built within 3 feet of each other, should have the walls next to each other built of brick.

8. That the owner of an estate on which a fire originates should be responsible for damage caused by the spread of the fire beyond his own estate, if it should be proved that in his building the foregoing provisions were not complied with. A certificate from the inspector of buildings shall be considered sufficient evidence of such compliance, if the building shall not have been altered since the certificate was issued.

VENTILATION OF THE HOUSE OF COMMONS.

AT the first meeting the committee, consisting of the Right Hon. David Plunket (chairman), Sir Henry Roscoe, Sir Guyer Hunter, Dr. Farquharson, and Mr. Richard Power, the question of the ventilation of the House of Commons was considered.

Mr. James Taylor, surveyor to Her Majesty's Office of Works, gave evidence as to improvements which might be carried out for the better ventilation of the committee-rooms and corridors of the House. He was in favour, on the whole, of the substitution of the plus-pressure system for the system of extraction by means of furnaces. The adoption of that system in the debating chamber would not interfere with the ventilation of the corridors, and that was the system he would employ if he were constructing a new House of Commons.



Mr. William Prim, consulting engineer to Her Majesty's Office of Works, gave evidence as to the improvements which had been effected in the ventilation of the kitchens and in the air intakes in the "No" division lobby. In the "Aye" division lobby no change had been made, but it was proposed to make a great alteration where the tellers stood, so as to take off some of the air from there while a division was in progress. There were complaints now of draughts by reason of the opening of all the doors right through the House down to the terrace to allow the rush of members for a division. Explaining the system adopted to keep out fog, he said the openings from the courtyards were closed and the chamber sealed as much as possible against fog coming in from the sides. Air was drawn in from the terrace and passed through jets of water, so that the heavy particles might be deposited. It was then driven by a fan through layers of cotton-wool, 6 feet thick, and after thus filtered it passed through the body of the House. In a short time the wool became black and full of an oily and sooty substance, which had the smell of a very bad fog. There was a considerable difference between the colour of the outer and inner layers of cotton, the latter being much whiter. When they changed the wool they put the inner layer outside and a fresh layer inside. It depended upon the density of the fog how often the wool required changing; he had known it need renewing after forty-eight hours on one occasion when they had a continuous fog for that time. Last winter it was changed three times, at a cost each time of 20*l.*, so that the air of the

Brass Wheel, Iron Fittings		

This thoroughly efficient Screw Adjustment provides for opening, closing, and securely fastening Fanlights, Casements, &c., and will by its extreme simplicity commend itself to Architects, Builders, &c.

Working Models of the above and other Specialties may be seen at our new Show-Rooms, 57 HOLBORN VIADUCT, E.C. Architects and Builders are invited to inspect same.

House was filtered at a cost of 60*l.*, the original expense of the steam that worked the fan having been 200*l.* or 300*l.* The present filter could be extended further along the vault, but he left that question over till it was decided what should be done in other directions, Sir Henry Roscoe, for instance, having expressed an opinion that the filter should be in constant use. Speaking of the quantity of air supplied to the House, he said that on the second reading of the Government of Ireland Bill in June 1886, the quantity of air supplied to the House of Commons was 1,200,000 cubic feet per hour, while the number of persons in the chamber at the time of the division was 905, made up as follows :—Members, ayes, 311 ; noes, 341—total of 657. Strangers, including the occupants of the Ladies' Gallery, 232 ; and clerks, doorkeepers and attendants, 11. Thus the air supplied per individual was at the rate of 1,326 cubic feet per hour, or 22 cubic feet per minute, while the cubical contents of the Chamber being 165,000 feet, the air therein was changed every eight and a quarter minutes, or 7·272 times in an hour. On the occasion in question the temperature both of the Chamber and out-of-doors was as follows :—At 4 P.M., 65 deg. out-of-doors and 63 deg. in the Chamber ; at 5 P.M., 67 deg. out-of-doors and 65 deg. in the Chamber ; at 7 P.M., 64 deg. out-of-doors and 67 deg. in the Chamber ; at 10 P.M., 59 deg. out-of-doors and 64 deg. in the Chamber ; and at 1 A.M., 56 deg. out-of-doors and 67 deg. in the Chamber. The increased temperature of the Chamber between the hours of 10 P.M. and 1 A.M. was in a great measure attributable to the crowding of members at the chair and bar ends of the House, where the thermometers are fixed. Attendants went round and took the temperature right through the whole building every hour, and a record of the temperature was kept for every hour of every day during the session. Sometimes when the House had been sitting for a long time he was asked by the Speaker or the Serjeant-at-Arms to raise the temperature and to keep it high as the night advanced, when, no doubt, members got tired and required more warmth. If an individual member asked to have the temperature raised, he referred him to the Speaker. Mr. Cowen had said that he never knew a building that took it out of a man so much as the House of Commons. But when witness asked him whether he had ever spent so many hours in another place, such as a church or the Royal Italian Opera, he admitted that he had not. Mr. Prim then went on to speak of the way in which the House was warmed in cold weather and cooled in hot weather by means of cold air passing through a steam arrangement called batteries. The temperature in the debating chamber of the House was kept pretty equal at from 62 degrees to 64 degrees, except when the outside shade temperature was very high, when the House would feel like an ice-well, with a temperature as low as 64 degrees. Bad smells came into the House from passing barges, steamboats sent in smoke, and when there was an easterly wind they got smoke and fumes from the potteries on the other side of the river. But on the whole he preferred the air from the terrace to the air from the courtyard. As to further improvements in the ventilation of the House, he said it was proposed to open some flues which formerly supplied the ladies' gallery with air, but they were stopped up as being inconvenient, and in that case the ladies' gallery would receive a supply of fresh air above the heads of the reporters instead of from below. The Strangers' Gallery was plentifully supplied with fresh air, but regarding the House as a theatre, the Strangers' Gallery representing the boxes and floor of the House the pit, it would be impossible to prevent the air from the Strangers' Gallery passing into the House.

NOTES ON TIMBER.—III.

Scaffold and Ladder Poles.—As already stated, these are the young spruce and larch trees, stripped of their branches and chiefly imported from Norway, the smaller sized poles being termed rickers, and sold at about 1*s.* 7*d.* to 2*s.* each, whilst the larger poles are classed according to the diameter of their butts, as over or under 4 inches, and are sold by the foot run at varying prices, according to the supply in the market, of which the following may be taken as samples :—

Scaffold poles,	20 to 30 feet long,		2½*d.*	per foot run.
,,	30 ,, 40	,,	3*d.* to 4*d.*	,,
Ladder poles,	20 ,, 30	,,	3*d.* ,, 4*d.*	,,
,,	30 ,, 40	,,	4*d.* ,, 5*d.*	,,
,,	40 ,, 45	,,	5*d.* ,, 6*d.*	,,
Gross poles	30 ,, 40	,,	6*d.* ,, 7½*d.*	,,
,,	40 ,, 45	,,	7½*d.* ,, 11*d.*	,,

is called deal. In this form it comes into the market sawn into different widths, which though often collectively classed as deals, are distinguished as battens, deals and planks, varying from 2 inches to 4 inches thick, but mostly 3 inches, and in length from 8 to 20 feet, but chiefly 12 feet, all under 8 feet in length being classed as ends and sold at a cheaper rate. They are termed battens when 7 inches wide and under, deals when from 7 to 9 inches wide, but mostly running 9 inches, and planks when over 9 inches, though mostly running 11 inches in width.

Baltic Deal.—Baltic deal is either called yellow deal, in which case it is merely the red fir timber (Scotch fir or *Pinus sylvestris*) sawn up, or else white deal which is prepared from white fir timber (spruce fir or *Abies excelsa*).

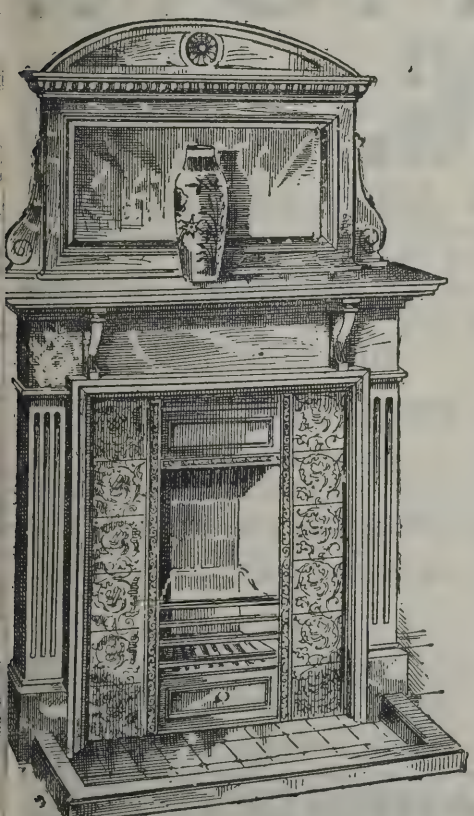
Yellow Deal.—The best yellow deal for building purposes is shipped from the Russian ports of Petersburg, Onega and Archangel, and the Swedish ports of Soderhamn, Gefle, Stockholm and Holmsund. Onega and Archangel, in the White Sea, and Gefle furnish little but deals of the best quality; Petersburg deals are apt to be shaky, leaving a great many centres in the planks and deals, but the best qualities are very clean and free from knots. Wyborg chiefly sends cheap and sappy battens.

The greater portion of the Swedish timber, both converted and unconverted, is coarse and bad, but at the same time some of the very best deals, both yellow and white, come from Gefle and Soderhamn, therefore it is absurd to specify that Swedish timber will on no account be permitted to be used; the majority of the stocks in the market are Swedish, and very few would be any the wiser if a contractor systematically ignored such a clause in a specification. The best Swedish deals run more sound and even in quality than Russian shipments, owing to the different way in which the timber is converted in the two countries. For instance, a balk of Russian timber is all cut into deals, &c., of one quality, and hence the numerous hearts or centres always to be found amongst them, which are so liable to shake and split, whereas in Swedish timber the inner and outer wood in the same balk are converted into different quality deals, the centres being put with a lower class, and hence the high value put upon first-class Swedish goods.

Four-inch deals should never be used for cutting into boards, as they are of necessity cut from the centres of the logs, and 3-inch deals, the general thickness of Russian goods, are also open to the same objection. Swedish 2½-inch and 2-inch deals of good quality are to be preferred to 3-inch, since they are all cut from the sound outer wood, although, being a novelty in the market and therefore their value not being understood, they do not fetch such high prices as the 3-inch. The only good Norwegian yellow deals come from Christiania, but they are very scarce now, only one or two shiploads finding their way to the London markets in the course of the season, therefore it is useless to specify, as is frequently done, that "all floorboards, &c., are to be of the best Christiania yellow deals."

The export of deal from the Russian ports of Dantzic, Memel, Stettin, &c., is almost entirely confined to yellow planks and deck deals, also called red deals, from 2 to 4 inches thick, which are used principally for ship-building, but may often be employed with advantage for cutting up into scantlings suitable for framing of roof trusses and other similar purposes connected with house-building and engineering constructions. The reason why the shipments from these ports are almost entirely confined to timber in its unconverted state is that the wood, from its having been grown in a warmer climate, is coarse and wide in the grain, and therefore could not compete in a converted state —as deals, &c.—with the closer-grained and cleaner exports from the more northerly ports of the Baltic. Whilst, on the other hand, though hewn timber could be obtained from the northern ports of the Baltic of a cleaner and closer grain, owing to the slower growth, than that got from the more southerly ports, the extra price which would be charged for freight would be quite sufficient to put it out of a market in which the competition is so keen.

White Deal.—Some of the best white deals come from Christiania, but that from the other Norwegian ports is not to be relied on, being apt to warp and split in drying; large quantities, however, of these inferior shipments are used for such common purposes as making packing-cases, &c. The best Russian white deals, &c., are shipped from Onega. Petersburg white deal, though generally finer and closer in the grain, is given to shrinking and swelling according to the hygrometric state of the atmosphere. Riga, which is about the most southerly port from which considerable shipments of deals are made, sends white deals only into the market; they are, however, considered to be inferior to Narva and Petersburg white deals, being coarser and more open-grained than either.



In white deal the sap wood can hardly be distinguished from the heart wood, whereas a lot of yellow deals may readily be recognised by the sap wood, which more or less discolours the edges of most of the deals. The annual rings in white deal are not so marked or red coloured as in yellow deal, whilst the knots are much harder to cut with a knife, and very liable t

become loose. It is not so durable as yellow deal, especially under exposure to the weather, but is much used for internal work, such as cheap doors and floors not exposed to great wear and tear; it is nice clean wood for tops of dressers and common tables, as also for shelves, but on account of its liability to warp should not be cut too thin, not under an inch if possible.

THE MANCHESTER SHIP CANAL.

SINCE the flooding of the length of the Manchester Ship Canal between Eastham and Ellesmere Port some disquieting statements have, the *Manchester Guardian* says, been made with regard to slips and breaches in the embankment. It has been even suggested that a great portion of the embankment will have to be "reconstructed in a much more solid form." It may be well to say that there is not the least reason for alarm. Some mishaps, as was inevitable, have occurred, but all the injury that has been done a very few days' work will put right. The Eastham cutting was in progress for four years, and during that time was free from floods. It would have been remarkable if, when the water was at length admitted, there had been no such sliding of the banks as has occurred. But to speak of reconstruction in the large style quoted above is not unlike suggesting that a new mansion should be rebuilt because a small portion of freshly-placed stucco work had fallen. The bed of the canal is in some places of sand, and in others of rock. The slopes are for the most part of rubble handpitching, though in some parts fascine work, as in the low country canals, is used. Where the small slips or slides have occurred, the bed is of the more flimsy character, but there is absolutely no cause for anxiety. What has occurred was expected to occur, and possibilities much more serious had to be faced when the water was let in. There were indeed engineers who thought that the banks might in places be torn up by the sudden flood. There are altogether 70 miles of canal banks. For the most part they run through solid earth, in which of course no breach can occur. Where embankments have been necessary the Canal Company have gone to considerable expense in providing a superior kind of masonry, not a stone of which has given way. Now that the Eastham part of the canal is full, the motive power that has caused the small disturbances of which so much has been made is no longer at work.

Within a very few days the traffic of the Shropshire Union Canal from Ellesmere Port will pass down the ship canal and enter the Mersey through the Eastham gates. A hundred yards below the port the flooded portion of the ship canal is dammed up. At the point where the dam is made there is a breach in the estuary line of the canal wall. The opening is not wide, but it allows the tide to come up to the port, and is the present exit and entrance for barge traffic. When in the course of a few days all is ready for the operation the breach will be closed and the dam removed, and the only tide which Ellesmere will know is the tide which will come up the ship canal. Within five or six weeks after this portion of the work is accomplished, a stage even more interesting will have been reached. This will be the opening of a further length of about nine miles, stretching from Ellesmere Port to the mouth of the Weaver. The great salt trade of Winsford and Northwich will then be carried by way of the canal, with the merchandise which comes from the Midland navigations to Northwich, where the remarkable "Anderton lift" is a connecting link. There are a few points between Ellesmere Port and the Weaver at which work has yet to be done. The river Gowy, a tributary of the Mersey, has been one cause of trouble. The Canal Company were not allowed to impound the waters of this stream, and the result was that they had to carry them fifty feet below the surface of the earth, or a depth of sixteen feet below the bed of the canal. A tunnel was built under the new waterway, on the estuary side of which the surface was again found. Two syphons, each of 12 feet, now carry the Gowy on its underground way to the river. This has been a work of great difficulty, and has delayed canal operations at this point. On the excavation of the old bed of the Gowy men and machines are hard at work, and unless some unexpected hindrance occurs the trench will be very quickly completed. The course of the canal from Ellesmere Port to the Gowy is cut almost entirely through clay. The railway lines still run along the bottom, and here and there a big piece of machinery is to be seen. All that is left to be done, however, is what the men call "cleaning up." Passing on from here and within the estuary we come to a cutting in clay and sand, which stretches as far as the old Ince lighthouse. The width at the top is not less than 300 feet. On this reclaimed land it has been necessary to build very heavy embankments, finished off with what is known as dressed pitching, inside and out. In making these embankments it was necessary, to gain a firm foundation, to send a vast amount of timber deep into the earth by the process of "piling." At the

old lighthouse begin the Ince rocks, extending for about a mile. These presented a very solid buttress for the canal-makers to encounter. For four years the workmen have been blasting the barrier away, and to-day it is as clean-cut as sawn timber. At the top of the cutting we look from a height of not less than 70 feet over an absolutely perpendicular cliff. The section extends three and a half miles further, to the mouth of the Weaver. This part of the canal is completely finished, and for four months the surface water has been allowed to accumulate in it, till there is now a uniform depth of 5 feet. This finished portion looks extremely well, for there is no wide estuary with which to compare it. For the most part the straight line of banks is made of pitching, of a sandstone redness, but in places the surface is agreeably broken by fascine work. This style of embankment is not uncommon on the canal, and though it is not perhaps quite so strong a protection as the rock, it is certainly more picturesque. The branches of the osier and the willow are thickly laced and laid in line on the banks, into which they send roots and make firm the soil. Very quickly they send forth shoots, and in places where the planting is not quite recent the banks are now pleasantly green. The canal wall is carried on through the estuary and in front of the mouth of the Weaver. Within the next few weeks that river will discharge itself no longer into the Mersey, but into the canal. The canal people, however, are by Act of Parliament prevented from robbing the Mersey of this quantity of water, and the problem of the engineer was how to meet this condition. This has been done by the erection of the largest sluices which the world has yet known. They are ten in number, each 30 feet wide, and the machinery is so perfect that a young boy could control it. The sluices are used not merely to regulate the passage of the Weaver water out of the canal, but to admit the tidal flow. With their solid masonry and vast roller frames they present a very imposing piece of engineering work. Side by side with the sluices is a weir in the embankment, 600 feet long, at a level of 14 feet 2 inches, which is the mean level of high water and the height at which the water opens the lock gates at Eastham. The embankment of the Weaver pens the water up that river to Frodsham, a distance of three miles from the canal. This will form a large sheet of water which, after dredging, will be available for vessels of any size. A lock is quite complete which will connect this dock with the Weaver navigation (which is built parallel with the river), and through the lock will come the large and important traffic from the salt districts of Cheshire. The lock is of very considerable dimensions, being 229 feet long and 42 feet wide; other locks are being constructed a short distance above the Weaver to admit boats to and from the docks at Weston Point and Runcorn. This work, however, will not be finished for some months to come. It is the length from the mouth of the Weaver to Eastham with which the makers of the canal have been most concerned hitherto, for it was directed by Parliament that this section should be opened before certain points nearer Warrington could be touched.

NIGHTINGALE'S BEVELLED WOOD-BLOCK FLOORING.

MESSRS. NIGHTINGALE & CO. have had more than twenty years experience in the handling and seasoning of timber, and hence the work executed by them may be trusted to be proof against dry-rot and dampness, sap, curling, shrinkage, &c. Floors can be laid in any variety of pattern, herringbone, interlacing, for aisles or corridors, for dining-rooms and large areas, &c. Among the woods generally used are redwood, oak, walnut, chestnut, pines, teak; and, if desired, the floors can be stained to any shade at a small cost. The advantage of the latter process is seen in the less frequent washing of the floors that is required. Messrs. Nightingale & Co. are sending out yearly from their works at Great Grimsby increasing quantities of their new and improved wood-block flooring. Besides being practically noiseless, they are firm and solid to the tread, and warmer than ordinary board floors. Special means are taken for the permanent fixing of the blocks so that they cannot get loose or be kicked up. The blocks fit with close joints, and dust or dirt cannot therefore enter between.

GUILD AND SCHOOL OF HANDICRAFT.

ON Saturday a garden party was held at Essex House, Mile End Road, for the purpose of inspecting the new premises of the School of Handicraft. The house, apart from its historic claims of interest, having been built by the Earl of Essex, of Elizabeth's time, has many attractive features. Mr. C. R. Ashbee, the present proprietor of the house, and by profession an architect, has given up his abode in order to advance the knowledge of old English handicrafts, by establishing a school where men can work on a co-operative system and boys may learn various trades. Advantage was taken of the occasion to

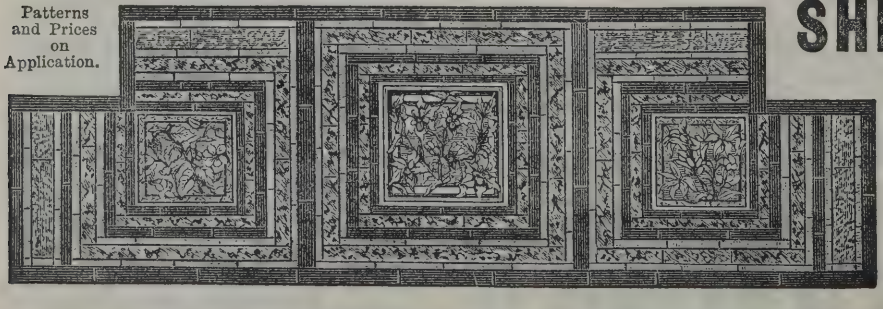
open the new workshops and hall, which had become necessary owing to the growth and development of the school. In accordance with the system carried out ever since the foundation of the school, the work was of an entirely practical nature, and had direct relation to the industrial training of the pupils. Among the new lines of work at present being taken up or about to be taken up by the school, and in addition to those already taught, are classes for brazing and metalwork, gold and silversmith's work, English leather industry, guild and school press. The classes are conducted by professional and skilled men, and are for the training of men in trades or of men who have the training of the young artisans of the future in their hands. In addition to the workrooms, there is a large garden with lawn-tennis courts. The Marquis of Ripon, in the course of his address, welcomed all to the new building. They were fortunate in finding such a locality, and the guild and school had found an excellent habitation. He hoped it would prosper and fulfil all the work it had set before it.

CITY HALL, PHILADELPHIA.

THE *Scientific American* gives details of the progress of the great tower of the City Hall, Philadelphia. No one, it says, has visited Philadelphia without being struck by the splendid pile. For many years its walls have been gradually rising, and although the main portions have been finished and occupied for some time, the tower, which is intended to crown the whole work, has but slowly reached up into the sky. The marble work is now finished, and it only remains to put up the iron upper work, when the whole will be completed. The tower, although unfinished, is already 350 feet high. The total height when completed will be 547 feet 2½ inches, and will only be surpassed in this respect by the Eiffel Tower and the Washington Monument, which surpasses it by less than three feet. Without including the court, the building covers 4½ acres, and has a frontage on one side of 470 feet and on the other of 486½ feet.

John Ord, architect of the city of Philadelphia, who is now in charge of the work inaugurated and carried almost to completion by his predecessor, the late John McArthur, jun., said:—We are now engaged with the construction of the iron superstructure or tower which is to crown the stonework now in position, and make the new City Hall of Philadelphia, when completed, the highest building in the world, with the exception of the Washington monument. In all the work carried on at anything like such an elevation as this, the greatest precaution must be taken to prevent stray nails, blocks of wood and workmen's tools from falling through such a great distance, and to insure against this it is necessary to rig an enormous circular platform, consisting of a hub with huge yellow pine outriggers. This platform will weigh 150 tons when placed in position, and in shape will resemble a huge cartwheel. The centre of the platform, or what I have called the hub, is fastened to the eleventh storey of the tower or the top of the stonework, while the spokes stretch out 55 feet horizontally, extending about 20 feet beyond the outer walls of the tower. These spokes are 15 inches by 18 inches in diameter, and are united by a wrought-iron fish-plate. The outriggers are twenty-four in number, weighing, in all, 168,000 lbs. Joists 3 inches by 14 inches fastened to the outriggers will support an oak plank floor 4 inches thick.



The platform is encircled by a heavy railing, and will be the base of operations for the erection of the most elaborate metal tower in existence. The clock storey of the tower, 67 feet in height, will be supported by sixteen cast-iron columns, each 35 feet long and weighing 15,000 lbs. The supports for this enormous weight will be furnished by a wrought-iron skeleton structure, consisting of eight composite columns resting on four box girders, which are set in position on top of the present granite bond stones, with cast-iron bed-plates to secure a solid bearing throughout the structure. These girders will afford a support for eight vertical columns, standing 67 feet 8 inches above the stonework, and converging at this distance to a recent, in order to furnish a support for the Penn statue.

The columns are made in pieces of varying length, and are to be erected in several stages in height. Each of these stages is to be composed of eight posts, firmly secured and braced horizontally and diagonally, and made absolutely secure before the next succeeding stage is erected. At the level of 67 feet 8 inches above the marble work a floor will be constructed of 9-inch rolled I beams, weighing 70 lbs. per yard, resting on eight cantilever trusses. These trusses will be secured to and spring from each of the main posts, and are to abut upon and be keyed up to a ring of wrought-iron, 3 feet deep and 13 inches clear internal diameter, forming an open "well" in the centre of the floor. Another floor will be constructed on the top of the eleventh stage of seven 55 lb. I beams, which will be covered with cast-iron plates bolted to them. This floor will give access to a small gallery or balcony, which will be supported on strongly-framed wrought-iron brackets and protected with heavy

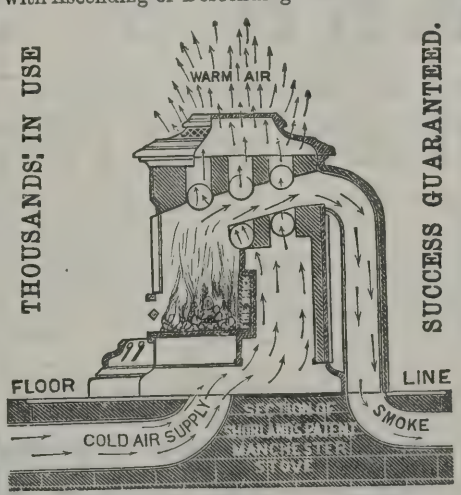
railing made of gas-pipe rails and bolts, thoroughly bolted to cast-iron work. A supplementary frame will be constructed outside of this frame, to give support to the outside cast-iron shell. Aluminium will probably be the metal used in the external covering of the dome and in the construction of the ornamental groups. The clock storey is now in course of erection at Tacony, where it is to be erected in its entirety. It will then be taken apart, the segments being carefully numbered and taken to Philadelphia, where they will be put together permanently. The top of the clock storey will, however, be kept at Tacony to serve as a base for building the next storey. An important factor to be considered in the erection of the tower is the elements. Great precautions must be taken against damage by cyclones and heavy gales at such a high altitude. With this end in view calculations have been made, and it is estimated that each square foot of the tower will resist a wind force of 50 lbs. The statue of Penn, which is to surmount the tower, is now about completed, and is said to be the largest iron casting in the world. Penn will be taken to this city in forty-seven pieces, and will measure 36 feet from the soles of his feet to the crown of his hat.

Some idea of the enormous size of this figure may be gleaned from some of the measurements of his person. The enormous height of the tower is shown by the fact that the statue dwindles into a pygmy when mounted on the apex of the tower. The head is 4 feet in diameter, and 7 feet long with the hat on. The nose is 15 inches long, and the distance between the eyes 16 inches. The eyes are 9 inches long and the mouth is 12 inches across. Penn's hat is 12 feet in circumference. It is 4 feet high, and the rim is 8 feet in diameter. It has been estimated that he wears a No. 52 hat. The calf of the leg is 9 feet around, and the upper leg measures 15 feet. The foot is nearly 6 feet long. His finger nails are 5 inches long, and the middle finger is 2 feet 6 inches long.

The four large ornamental figures are also of cast-iron structurally. They are a hunter, an Indian with a boy, a Swede, an Indian with a dog. Each of these figures will be cut into eighteen pieces before being taken to this city. One will be placed over each corner of the clock tower, between them being the four American eagles. Eight lunette windows will furnish light and ventilation to the upper part of the dome. In the construction of the tower at Tacony the greatest efforts were made to secure competent and skilled artisans and to provide all the facilities required for turning out the best work. And it is believed that this has been accomplished. The pins which are to fasten the iron pieces together are of hardened steel 2½ inches in diameter and 16 inches in length. The plaster models from which the clock storey and the statue have been fashioned were all made at this office. A delicate piece of work will be the placing in position of the statue. The pieces of which it is composed will be carried from the base of the tower to the scaffold by the tower elevator. Here by steam power they will be elevated piece by piece and placed in permanent position, beginning with the feet and building upward. Special hoisting machines will be employed to elevate the heavier pieces of the iron superstructure. Each separate piece of cast-iron work, and also the fastenings, after being fitted, will be heated to a temperature of 300 deg. F. and immersed in a bath of pure linseed oil. Another interesting piece of work will be the counterpoising of the statue. This will be done by means of a mass of metal 5 feet long and 2 feet in diameter, firmly keyed into a flanged shaft, which in turn is keyed into the cast-iron cap-piece of the statue. Great care will be observed in constructing the machinery that will be used in elevating the statue of Penn and placing it in position. This apparatus will consist of eight huge timber posts secnrely fixed below the base of the statue. To these posts stout tackle will be attached, and steel cables will be employed to hold the different parts of the statue in position while awaiting permanent position.



THE LONDON HOSPITAL.

THE Duke of Cambridge, as president of the London Hospital, paid a visit on Saturday, the 27th ult., to the East End for the purpose of opening the new buildings which have just been added to the London Hospital. The new front which has been added to the hospital gives it a far more stately and imposing effect than that of the flat, dingy-looking walls which were such a familiar feature of Whitechapel Road, but it was not on account of æsthetic considerations that the important alterations were undertaken. For a long time past the growing demands upon the hospital have rendered its very limited accommodation extremely inconvenient, the operating theatre in particular being totally inadequate to the requirements of modern surgery. The additions made begin with a fine portico entrance from the street, through which the main hall of the building is reached. On the right side are the waiting and receiving-rooms, rooms for the examination of both male and female patients, and some rooms for the nurses. On the

left side the chief apartment is the students' day-room. On the first floor most of the space is filled by the new chapel, and on the second floor are the well-arranged surgical and clinical theatres. Both these rooms are 40 feet long and 23 feet wide, and are beautifully lighted from the roof. Mr. Roland Plumbe was the architect. The entire expenditure has been 16,000*l.* for the buildings, and 9,500*l.* for the general repair of the sanitary arrangements throughout the hospital. Of this a very large sum remains yet to be raised. After the opening ceremony the Duke, before the dedication of the chapel, inspected the alterations that had been made.

No unnecessary money has been spent upon the ornamentation of the chapel, which, however, looks bright and devotional with its good proportions and painted walls. It is about 80 feet long, and has a gallery at the western end. A handsome stained-glass east window has been given by Mrs. Coope and her family in memory of her late husband, Mr. O. E. Coope, M.P., who was a generous benefactor to the hospital. The seats, pulpit and chancel furniture of the old chapel have been used again, and the former organ will also be restored in due course.

REGISTRATION OF PLUMBERS.

AT a meeting of the District Council for the counties of Forfar, Perth and Fife, held at the Town Hall, Dundee, the committee's report on the examination of students in the plumbers' classes for the prizes offered by the Plumbers' Company, London, was read and approved. The names of the successful students are as follows :—J. Littlejohn, A. Young, A. Ferguson, P. Edmonds and T. Kinnear (Dundee class) ; A. White, R. Emslie, D. C. Clark and G. Smith (Montrose class) ; T. Grant and J. Carver (Arbroath class). A communication was read from the Glasgow Council as to the programme of business of the Congress of Representatives of all the District Councils of Scotland to be held in Glasgow on July 29 and 30, and the same was considered satisfactory. The final proof of the programme will be submitted to the several councils early in July. Ten delegates were appointed to represent the Dundee Council at the Congress, viz. :—J. Wood, A. Davidson and J. S. Jack (master plumbers) ; J. Bryan, A. Stewart and W. Fenwick (operative plumbers) ; Dr. Lennox, Thomas Kinnear, sanitary inspector, and ex-Bailie Stephenson (public representatives), and J. J. Henderson (secretary of the District Council). The Secretary was also appointed as a delegate from the Council to attend the International Congress of Hygiene to be held in London in August next, and the hope was expressed that Lord Provost Mathewson, Mr. W. Mackison and Mr. Thomas Kinnear, who are at once members of the District Council and delegates from the Town Council of Dundee, would be able to cordially support the various propositions which might be suggested at the Congress in favour of the education and registration of plumbers. It was mentioned that at the Congress opportunities would offer under various sections of the proceedings for the discussion of the education, position, duties and responsibilities of plumbers. Reports were given of the satisfactory progress of the registration movement in Scotland and throughout the United Kingdom.

GLASGOW ARCHITECTURAL ASSOCIATION STUDENTSHIP.

THE subject for the prize competition for 1892 (twelve guineas) is a design for an art gallery and museum, on a site 120 by 70 feet, as shown in the diagram, to include picture and sculpture galleries, museum and curator's house. Drawings required: plans of each floor, two elevations, one section, one sheet of details. General drawings to be on the scale of $\frac{1}{8}$ inch to a foot. Details to be on the scale of $\frac{1}{2}$ inch to a foot. Anything not expressly stated in the above conditions to be regarded as at the option of competitor. Particular regard will be paid by the adjudicators to the constructive skill displayed. Drawings must be signed by a mark or motto only, and lodged with the Secretary of the Association not later than February 1, 1892.

They must be accompanied by a sealed envelope, endorsed with the mark or motto, and having enclosed the name and address of competitor. Competitors are invited to forward with their design any sketches and measured drawings; the quality of these may influence the adjudication. The successful competitor must arrange within twelve months to make a tour of not less than fourteen days' duration, and out of Scotland, for the purpose of architectural study, and must, on his return, submit to a meeting of the Association, as may be arranged by the general committee, his sketches or measured drawings, and read a paper descriptive of the subjects visited. The competitive drawings will in all cases remain the property of the designer, but the committee may exhibit them either publicly or at an ordinary meeting. The prize for 1892 will be twelve guineas. Power is reserved to decide all questions which may arise, and to withhold the prize should none of the sets of drawings appear of sufficient merit.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and informations relating to Patents may be had gratuitously.*]

BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE
LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. TRADE NOTES.

THE new schools, Truro, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates and exhaust roof ventilators, the same being supplied by Mr. E. H. Shorland, of Manchester.

THE New Hall, Southampton, has just been completed from the designs and under the superintendence of Mr. Sidney Kelway Pope, M.S.A., who has given special study to the question of ventilation. Mr. Pope recognised the importance of having an efficient scheme, and after careful consideration entrusted the work to the Climax Ventilating Co., 15 Great George Street, Westminster, and has adopted their appliances with great success and satisfaction.

AMONG works being carried out by Messrs. Mark Fawcett & Co. are the following:—At Lincoln, where Messrs. Doughty, Son & Richardson are making extensive alterations to their linseed cake mills, the fireproof floors are being constructed by Mark Fawcett & Co. The fire-resisting qualities of this particular construction are so obvious and so generally recognised that, in consequence of its adoption in this building, the insurance company have consented to make a reduction from 2*l.* 2*s.* to 10*s.* 6*d.* in the premium. Another work, one of the largest undertakings probably at the present time, is the large block of flats now in course of construction on the site of the old Fisheries Exhibition, between the Albert Hall and the Imperial Institute. Some idea of the magnitude of the work can be obtained when it is mentioned that there are 16 acres of fireproof flooring in the mansions, which is being constructed on Fawcett's system. Also extensive alterations are being made at 4 and 5 Tokenhouse Yard, for the London and Westminster Bank, where the fireproof floors are being constructed on Fawcett's system.

THE well-known sanitary engineers, Messrs. J. Tylor & Sons, Limited, of 2 Newgate Street, London, E.C., have announced the issue of 250 five per cent. debentures of 100*l.* each, being the balance of an issue of 500, secured on the whole of the undertaking and property of the company. The capital of the company is 100,000*l.* in 10,000 10*l.* shares, of which 4,000 fully paid and 2,000 5*l.* paid shares have been issued. The company has also the power to issue 500 100*l.* mortgage debentures, bearing 5 per cent. interest, having a first charge on the undertaking and property of the company, and continuing subject to notice, and repayable as drawn, over 20 years, commencing in 1896. Of these debentures a second issue of 250 is now offered for subscription, to provide for the purchase of a freehold site of 2¼ acres (near King's Cross), and the erection of necessary buildings for a largely-increased factory. These debentures are only offered to customers and personal friends, and will be allotted in proportion to the amounts applied for. Applications to be made not later than July 29, 1891.

WITH reference to the invitation of the municipality of Sofia for tenders for the canalisation or drainage of Sofia, a complete set of the plans has now been received at the Foreign Office, and may be inspected there between the hours of eleven and five.

AT the meeting of the Birmingham School Board, attention was called to certain allegations made at a recent meeting of the Trades Council, to the effect that some of the Board's schools were being provided with "shoddy" furniture. It was asked if these allegations were true, and what had been done in the matter. Dr. Gardiner said that an expert in whom he had the greatest confidence assured him that for the price the Board had given the furniture was such as might be expected. The Board's mistake had been in accepting the lowest estimate. Mr. Jephcott said that the Cabinet-makers' Society, who were chiefly interested, would be content if they could learn that the Board were prepared for the future to have furniture worthy of the name. Mr. Kenrick said he quite agreed that all the furniture should be of a better character; and indeed the com-

mittee at its last meeting resolved that the architects should obtain samples of furniture which, if approved, would serve as patterns. In the past the Board had been driven by the Department to cut down the expenditure on buildings (which included furniture), and rather than deprive the children of space by modifying the structures, they had thought it well to make the retrenchment on furniture; but happily the Department had of late taken a broader view, and he hoped the difficulty would not recur.

THE Town Council of Burton-on-Trent have decided to advertise for tenders for carrying out certain works of electric lighting in Wetmore Road, High Street and Station Street, lest powers might be given to an outside company to bring the electric light into the borough.

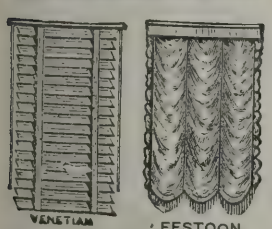
WORKS have commenced this week for the extension of the Shipley Local Board Waterworks. The head of the supply is 800 feet above sea-level, as compared with 700 feet and 750 feet, the highest altitudes in Shipley and Windhill respectively. The estimated cost is 10,000*l.*

THE local authorities have instructed the town clerk to communicate with a harbour engineer and request him to prepare the necessary plans and give a probable estimate of the cost of construction of a harbour at Macduff.

"FARMHOUSE and Country Lodgings in Essex, Hertfordshire, Cambridgeshire, Suffolk and Norfolk," a pamphlet issued by the Great Eastern Railway Company, will be useful to many during the holiday season. It contains nearly 1,000 names and addresses, with description of the houses, details of the districts, train service, &c.

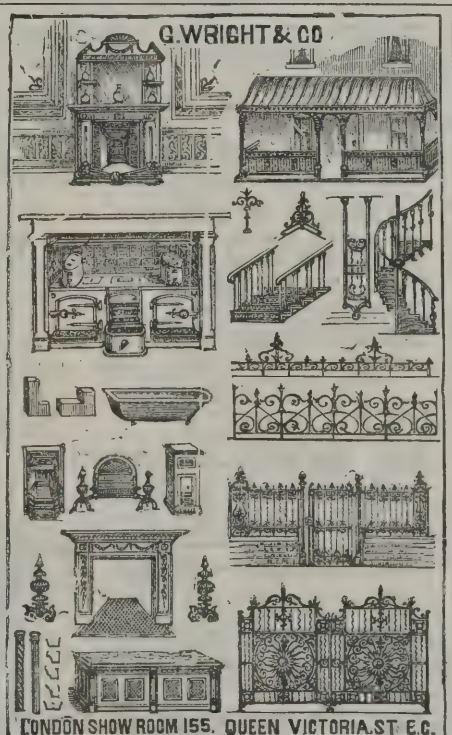
IN Brookfield Church, Gorton, a new baptismal font has been dedicated. It is a memorial to the late Rev. George Henry Wells and the late Mr. Peacock, and is in keeping with the architecture of the building. The bowl and stem, which are of quatrefoil form, are executed in white Sicilian marble with red Devon shafts, and it stands on an octagonal platform of Bolton Wood stone, 5 feet 6 inches in diameter. Upon the rim of the bowl is carved the dedicatory inscription :—"In memoriam. George Henry Wells. Richard Peacock. Erected by the congregation, 1891." The font has been designed by Messrs. Worthington & Elgood, architects, and Messrs. Patteson, of Oxford Street, Manchester, have executed the work in a very satisfactory manner.

ON Wednesday, June 24, the members of the Civil and Mechanical Engineers' Society visited the Chemical and Creosoting Works of Messrs. Burt, Boulton & Haywood, at Silvertown. They were received by Mr. Holmes, the manager, Mr. Gabbett, the engineer, and Mr. Ashley, the works foreman, who showed and explained the operations by which coal tar was distilled and converted into valuable products. The most useful of these from an engineering point of view was the creosote, or oil of tar. In this department the new mixer, designed by the engineer of the works for incorporating heavy liquids and semi-solids, attracted attention. In the timber department was seen an ingenious combination of rollers and canals for transferring the logs from the ship's side to the timber ponds. The creosoting cylinders, about 7 feet diameter and 60 feet long, were inspected, and the method of stacking and creosoting sleepers and pile timbers was seen in progress. The party then, by permission of the Thames Iron Works, passed through their yards, and came to the works of the Stamped Steel Axle Box Company, at Orchard Place, Blackwall. Mr. Cavanagh, the secretary of the company, introduced the members to Mr. T. Donelly, managing director. The advantages claimed for stamped steel as against cast-iron are extra strength combined with elasticity and less weight.



A COMPANY has been formed to acquire "The Tivoli" Theatre, Restaurant, &c., in the Strand.

AMERICAN NOTES.



THE *American Manufacturer*, of Pittsburgh, says :—The temperature tests taken by Mr. Hallack, of the Government Geodetic Surveying Corps, in the well of the Wheeling Developing Company located at Boggs' Run, just below the city, although not yet completed, have embraced a sufficiently wide range of conditions to give approximately correct results. The well is now down to a depth of 4,500 feet, and is the second deepest well in the world, the only deeper one being at Schladelbach, near Leipsig, Germany, which penetrated the earth to a depth of 5,740 feet. It was primarily for a salt well, but having attained an extreme depth the Government took the well in hand and continued it for scientific purposes. The temperature tests at the Boggs' Run well are taken twice a day, at 9 A.M. and 5 P.M. Reports from the different points in the well are secured at once by suspending three buckets, each 500 feet from the one next to it, in the well at one time. Each bucket is of copper, about 20 inches deep, filled with water, in which two maximum thermometers are suspended. The

buckets fit snugly to the sides of the hole, which is 4⅞ inches in diameter. The buckets are allowed to remain stationary for about twelve hours, and the heat from the surrounding strata in that time communicates itself through the buckets of water to the thermometers, where it is recorded. The highest temperature yet recorded is 110 deg. Fahr. at the bottom of the well, and the average increase of heat has been found to be about 1 degree for each 78 feet of descent.

AN illustration of the Coalbrookdale Bridge appears in the *Scientific American*, one of the most interesting bridges in England. It is located at Coalbrookdale, and is the oldest cast-iron bridge in the world. It was erected by Mr. Darby, the quondam owner of the Coalbrookdale Ironworks. It was erected in 1779. It reaches across the Severn with a span of 100 feet, while it has a total rise of 40 feet.

IN Sonoma county, California, may be seen a peculiar piece of engineering, namely, an actual railway bed on tree tops. Between the Clipper Mills and Stuart Point, where the road crosses a deep ravine, the trees are sawn off on a level with the surrounding hills and the timbers and ties laid on the stumps. In the centre of the ravine two huge redwood trees, side by side, form a substantial support. These giants have been lopped off 75 feet above the bed of the creek. This natural tree bridge is considered one of the wonders of the Golden State, and for safety and security is stated to far exceed a bridge built on the most scientific principles.

BUILDING AND BUILDERS.

WARRANT for the reconstruction of St. Cuthbert's parish church, Edinburgh, has been granted by the Dean of Guild Court. Mr. Hippolyte J. Blanc explained the special means proposed to be adopted to secure the comfort of the congregation in the matter of fresh-air supply and vitiated air outlets, and also in the arrangement of staircases and exit doors, heating apparatus, &c.

THE extension of the Warrington Infirmary has been commenced by Messrs. Gibson & Sons, contractors. A separate building will be erected on a plot of land in the gardens purchased from the Corporation, and outside the land owned by the Infirmary trustees. The plans have been prepared by Mr. W. Owen, architect.

PLANS are being prepared by Mr. C. J. Ferguson, architect, for a new workhouse chapel for the Carlisle Board of Guardians.

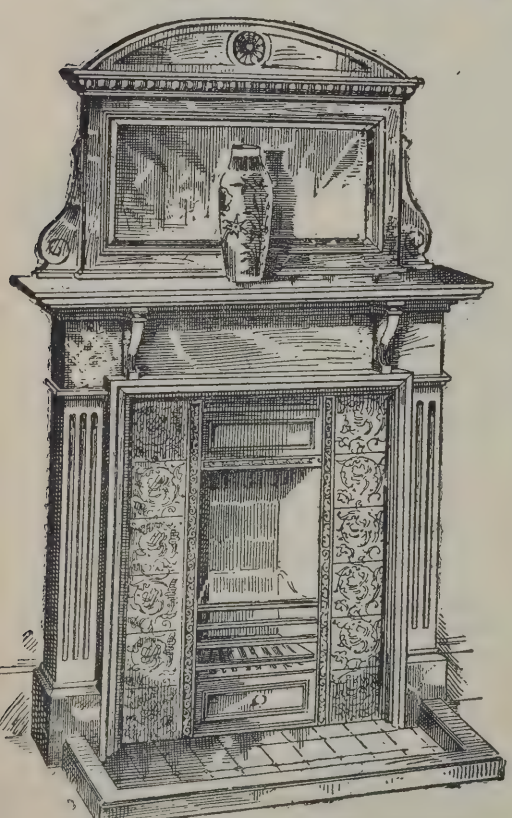
AN order of the Local Government Board sanctioning the scheme proposed by the Corporation of Salford under the Housing of the Working Classes Act, 1890, on Tuesday, the 7th inst., came before a Committee of the House of Commons in the form of a confirmatory Bill. The order relates to five unsanitary areas condemned by the local authority, and the estimated cost of purchasing the property, laying out new streets and erecting dwelling-houses for the working classes is 63,370*l.*, and the Bill was passed for third reading.

THE scheme for the erection of Market Buildings and a Corn Exchange was discussed at length at the meeting of the Gainsborough Board of Health. Some of the members advocated setting back the building to widen Flag Lane, and give the building a more uniform aspect. The architects informed the Board that to set back 3 feet at the widest part of the building would effect a great saving in regard to the main cost. The Board, by a majority, declined to sanction the loss of covered market space that would be thus involved, and the building will be erected to the utmost limit of space.

NEW municipal buildings erected near the old Guildhall at York have been opened. They provide offices for the departments of the town clerk, the city surveyor, and the city accountant, together with a council-chamber and various anterooms. The estimated cost of the building, including furniture and site, is 16,000*l.* The building has been erected by Messrs. Lowe & Sons, of Burton-on-Trent.

THE Local Government Board have sanctioned a loan of 3,000*l.* for the erection of the Oswestry Municipal Buildings.

AN inquest has been held at Windhill, Yorks, concerning the death of John McLaughlin, who died as the result of injuries received in the fall of a scaffold at Windhill. John Dovenor, the foreman at the buildings, stated that the broken piece of wood was beyond the usual strength of such erections. He thought the workmen must have let the stone fall, or the "needle" would not have broken. A witness who was on the scaffold swore positively that the stone was not allowed to fall. The jury returned a verdict of death from "shock" resulting from injuries accidentally received.



THE new head-quarters of the 2nd W. Y. V. Royal Engineers, Leeds, was formerly opened on the 4th. The buildings comprise accommodation for the officers, non-commissioned officers and sappers, with a grand entrance parade, armoury, armourer's shop, clothing store, the commissioned officers' committee-room, band-room and music

Stained and Polished, complete.
Size of Opening, 38 in. by 38 in. £15 10s.

store, old clothing store, commanding officer's-room, adjutant's office, magazine and caretaker's quarters. The design has been prepared and carried out under the supervision of Mr. William Bakewell, architect (an ex-officer of the corps). Mr. Joseph Pullan is the contractor, and Mr. Charles Goulden has acted as the clerk of the works.

VARIETIES.

IN accordance with the provisions of the Warrington Borough Extension, Water and Improvement Act passed last year, the waterworks undertaking has now become vested in the Corporation. The cost of purchase is over 250,000*l.*

THE *Bolton Chronicle* says:—The extension of the Swan Hotel and the pulling down of the block of old property adjoining has led to the discovery of a number of old relics, but the most important so far is that made in one of the passages of the hostelry, and which led to the drawing-room. It is an old stone window, bearing the date 1637, and was found built up with brick and covered with plaster, the structure being apparently too heavy to be removed at the time an extension was made. From the position of the window and its surroundings it is evident that the Swan Hotel in the time of Charles I. must have stood quite twelve yards back from the present front, and had probably a courtyard extending to the old roadway, beyond which an excellent view of the country could be obtained. Old coins have been found during the excavations, and also a secret passage from one of the upper rooms.

IN the Holiday Fashion Number of *The Gentlewoman* is found—for the first time in a ladies' journal—a complete set of fashions for costumes for every purpose required during the holidays. There is also a story by Walter Besant and one by Nathalie, ex-Queen of Servia.

WE record with regret, the *Aberdeen Press* says, the death of Mr. James Keith, secretary and cashier at the granite works of Messrs. A. Macdonald & Co., Limited, Constitution Street, which occurred on Saturday morning, the 4th inst. Mr. Keith, who was about seventy-five years of age, has been in the employment of the company over forty-six years.

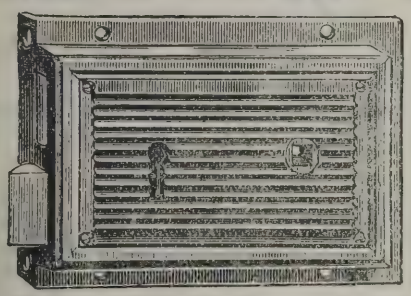
THE death is announced of Mr. Gibson Watt, whose mother was a granddaughter of James Watt. Mr. Gibson Watt assumed by letters patent the name of Watt in addition to his paternal name, under the will of his great-uncle, from whom he inherited the property of the Watt family, including the Heathfield estate and the mansion of Heathfield, Handsworth, Staffordshire (now occupied by Mr. George Tangye), where the famous private workroom of the great James Watt is carefully preserved, with all his tools, &c., just as he left it.

THE Mayor of Sheffield, Mr. Samuel Osborn, died on the 7th inst. at Blackpool, where he had been staying for the benefit of his health. He was head of the firm of Samuel Osborn & Co., Clyde Steel and Iron Works. He was master cutler in 1873, in which year, owing to unexpected difficulties, Mr. Osborn was compelled to suspend payment, with heavy liabilities. Mr. Osborn bought back the business by paying a composition of 12*s.* in the pound, and within ten years of his failure he was able to send cheques to all his creditors in full discharge of the debts owing by him when he became bankrupt.

PLANS are to be prepared for the immediate extension of the East and New Croydon railway stations of the London and Brighton Railway Company.

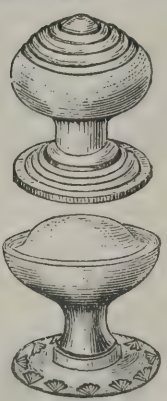
THE ironmasters of South Staffordshire have resolved to invite the Iron and Steel Institute to hold their annual meeting in Birmingham. The date of the gathering will be September.

APPLICATION has been made by the Huyton-with-Roby Local Board to the Local Government Board for sanction to borrow 3,000*l.* for the erection of public offices.

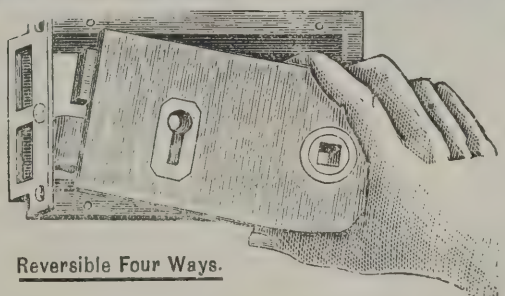


AT the meeting of the Dublin Corporation it was decided to obtain the opinion of expert consulting engineers on the question of the main drainage.

THE Bill promoted by the Salford Corporation to empower them to borrow an additional sum of 134,000*l.* for the purposes of the gasworks, 18,000*l.* on account of the waterworks and 50,000*l.* for drainage and sewerage has been reported for third reading.



THE Baths Committee of the Aston Local Board, with a view of reducing the cost of the proposed public baths, suggest modifications which will effect a saving of about 1,000*l.* They have conferred with Mr. Stephens, builder, and recommend the acceptance of his tender at the price of 13,059*l.*, subject to the deductions. A sum of 3,341*l.* is provided in the contract for engineering works, though the committee propose to deal with this portion of the works by separate contracts.



A LANDSLIP has occurred in the centre of Bilston, causing the destruction of a number of buildings, and threatening serious damage to the premises of the Great Western Railway, which

HILL'S PATENT LOCKS AND OTHER FITTINGS.

JAMES HILL, 100A QUEEN VICTORIA ST., LONDON, E.C.

runs near the scene of the principal damage. The settlement is believed to be caused by mining operations, the district being honeycombed by explorations in search of coal and ironstone.

"Hints on Sanitary Fittings and their Application" is the title of a little sixpenny book, written by Mr. R. M. Wharam and published by Messrs. H. & W. Brown, of Fulham Road. Mr. Wharam's practical acquaintance with the subject enables him to speak with authority, that the book will prove a useful guide now the majority of the public are so much engaged in setting their houses in order in respect of sanitary arrangements.

The Manchester Society of Architects has just been registered with limited liability without the addition of "limited" to its name.

NEW CATALOGUES.

An illustrated price-list has been issued, under date May 1891, by Mr. George Gunton, Costessey, Norwich, of ornamental brick chimneys. The chimneys illustrated are accompanied by sectional drawings, which show the details interiorly of plan, bases, caps, &c., all being drawn to scale. Mr. Gunton has a reputation for turning out good work, while in the matter of design the samples of chimneys shown are an evidence that, even in the plainest descriptions, the once proverbial ugliness of chimneys gives place to what is ornamental, the constructive details in a marked way helping to produce the design. About thirty-four designs are given in the list, and they show exceedingly tasteful treatment in the way of designing moulded brick chimneys. They are manufactured in either red or white brick. It is hardly necessary to add, what is pretty well known already, that Mr. Gunton carries out ornamental brickwork to architects' design, while the illustrations are evidence of what may be done with such humble appendages of our houses by thoughtful treatment.

SUBWAY UNDER THE THAMES.

The water supply for Nunhead and district is obtained from Hampton, being pumped thence by the Southwark and Vauxhall Water Company through some fifteen miles of iron main and stored for distribution in the reservoir at Nunhead. The supply of water has had to be increased, and this has been done under Mr. J. W. Restler, the engineer to the water company, by laying a second main from Hampton to Nunhead. This involved the construction of an iron subway under the Thames just below Kingston Bridge, which subway has recently been completed. It is circular in section, 9 feet diameter, and is constructed of cast-iron plates 1 inch thick, and bolted together in segments forming rings 18 inches deep. The method employed in driving the tunnel and fixing the plates was similar to that adopted in the construction of the City and South London Electric Railway. An iron shield of slightly larger diameter than the subway itself was forced forwards into the clay by powerful hydraulic jacks for a distance of about 18 inches, sufficient to insert one ring of the cast-iron plates. These plates were then fixed and bolted together in position, and the shield again impelled forward as before. By these means the earth in the tunnel was taken out as nearly as possible to the precise dimensions of the iron rings to be inserted. In order, however, to make the work perfectly solid and secure a grouting of liquid cement was forced in behind and around the rings when finally fixed, thus filling up every possible fissure and crevice between the iron and the surrounding clay. The subway is 600 feet long under the river, and it has been completed in the remarkably short space of nine weeks. The whole length of the tunnel is in the London clay, and at one point the thickness between the top of the subway and the bed of the river is only 2 feet 6 inches. It is fortunate for the contractors that the water did not break in at this point, or they would have been considerably delayed in their operations. The cast-iron main of 42 inches diameter, which conveys the water from Hampton to Nunhead, is divided in the tunnel into two pipes of 31 inches diameter each. The work has been carried out by Messrs. John Aird & Sons as contractors.

FIRE-RESISTING FLOORING.

The term "fireproof" as applied to flooring has almost become obsolete among those who have studied and endeavoured to improve the fire-resisting conditions of our buildings. Iron itself is not fireproof; as a matter of fact, it is very combustible when divided into small particles, and thus it may increase the intensity of an extensive conflagration when melted. In every elementary lecture on metals, pyrophoric—that is, atomic—iron is shaken from an hermetically-sealed tube, to show its ignition by contact with atmospheric air. Now, reasoning from this experiment, it is obvious that we must protect the iron

from becoming so heated that the air has sufficient access to its molecules to cause its own internal combustion. The running of iron under heat will first occur in cast metal, such as columns supporting the structural ironwork of large buildings. The writer of this article observed in Leeds a goods depôt belonging to the North-Eastern Railway, in which during a fire the cast-iron columns had run like melted lead, because the columns were not protected from the intense heat of the merchandise burning around them. This was a lesson not to be forgotten by architects connected with engineering work, and especially when dealing with depôts at large stations. Thus it happened that steps were taken to ascertain the best means of preventing the recurrence of such disasters, and the first full application of the results arrived at were shown in the goods station at City Road, Bradford. Certain experiments were made by Messrs. Dennett & Ingle, which conclusively proved that their concrete, 1½ inches thick, would not pass heat enough in eight hours to melt tinfoil. Therefore, by coating the columns of the City Road station depôt with 2 inches of this concrete, the architect was assured of the safety of the structure, so far as fire might affect the columns. There yet remained the wrought-iron girders to consider, for those would bend under intense heat, and, moreover, this work was designed with large spans—10 feet, as far as our memory serves. So not only was a fire-resisting material required, but one that would be stable and reliable under heavy loads. The course pursued was to use Dennett & Ingle's concrete for the flooring, and to encase the wrought-iron girders as well. This particular work has stood for something like fifteen years, and similar material has been used in other places and for other purposes. Engineers, who have sometimes the responsibility of advising architects in the construction of heavy works, may at times become conservative, and adhere to that work which they have found to stand the test of years and of heavy loads. Now, what we have found good in Messrs. Dennett & Ingle's concrete is that it is a non-conductor of heat, and that it can safely carry loads which are considerable on long spans, and therefore it is to be recommended for all works of magnitude or importance. We wish it to be understood that in these remarks, which refer especially to large structures, we do not depreciate the advantages of other fireproof floors, where small spans only are used, such as may suit dwelling-houses or small warehouses, which are entirely different in their requirements from the structures to which we have referred, and which require floors capable of supporting heavy loads.

REGISTRATION OF PLUMBERS.

THE District Council for Devon and Cornwall held its annual meeting in the Guildhall, Plymouth. In the unavoidable absence of the chairman (the Mayor of Plymouth), Mr. A. Groser presided. The secretary (Mr. T. N. Andrews) read a report, from which it appeared that two examinations had been held in the district during the year, and that the number of candidates who passed were 61 per cent. and 52 per cent. respectively. The Council had met eight times. The number of plumbers registered in the district was 35 masters and 54 operatives. A deputation from the Council had attended a large meeting at Penzance, and a local committee had been established there to carry out the registration system. The Council hoped that similar local committees would shortly be established at Exeter, Torquay, Truro, Barnstaple and Honiton. A special committee of the Council had drawn up by-laws for the district, which had been approved by the Plumbers' Company. Organisations for carrying out the national registration system were now completed in forty counties of England and Wales, and the system was also thoroughly organised in all the chief cities and towns of Scotland and Ireland. Upwards of 900 members of the organisation were acting on councils and boards of examiners in carrying out the system, and between 1,300 and 1,400 apprentices and operative plumbers attended the classes. During the past year about 1,500 plumbers had been added to the register, and in some districts they found that nearly all the plumbers had already registered. It was found that the general character of plumbing work in those places was improving, and that where registration had been most largely adopted the plumbing classes were best attended.

Mr. T. Brook, J.P., in distributing the certificates of registration granted by the Plumbers' Company to local master and operative plumbers, mentioned an instance where, through the carelessness of a plumber, the lives of 150 workpeople were endangered. He said it was for the possessors of those certificates to let it be their constant aim to act up to the knowledge they possessed and to never bring dishonour to the diploma or to the national registration scheme.

The Chairman said he regarded the movement with which most of those present were connected as being the practical application of the sanitary science of the country. No one concerned for the sanitary welfare of the people could fail to be interested in, and wish well to, the plumbers' registration system

FOR APPLYING the "SMOKE-TEST" to Drains, Soil-Pipes, Gas-Pipes, &c.

For Fumigating, Disinfecting, Destroying Vermin, &c.

FROM THE LONDON AND SUBURBAN SANITARY SURVEY ASSOCIATION.

"Connaught Mansions, Victoria Street, Westminster, S.W.: April 24, 1890.

"I have now had one of your 'Grahtryx' Smoke-Test Machines in use some time, and find it exceedingly useful and reliable. I inspect several hundred houses annually, and in many of them I find something more than the ordinary smoke tube absolutely necessary, and your machine meets that want. It is, I consider, the most portable, compact, well-fitted, and perfect little machine in the market, and invaluable to all Sanitary Authorities, Engineers, Inspectors, and Plumbers. It should also be of great value to Nurserymen, Plant-growers, Florists, &c., as an exterminator of green fly and other pests. I have tested it in this way in my own vinery, conservatories, &c., and find it most efficient when used with tobacco paper. It should also be of great service to gamekeepers for the rabbit warrens, and for bolting rats. "EDWARD TIDMAN, C.E., M.S.A., and M.P.S.I., and A.S.M."

FROM THE GLASGOW SANITARY PROTECTION ASSOCIATION.

"In reply to your inquiry, I have to state that I have had the Smoke Machine in daily use for over six months (on about 200 different occasions), and have found it very satisfactory, both as regards efficiency and handiness. "GILBERT THOMSON, M.A., C.E."

BAIRD, THOMPSON & CO., *Ventilating, Sanitary, Heating and Consulting Engineers,*

and all that tended to its advantage. What they wanted was that those who were skilled and trusted in their profession should be able to be identified by the public as distinct from those who were not to be trusted, and who therefore were put on one side. It was not the work which cost least which was really the cheapest, and he hoped that those who had to employ plumbers and all other men connected with skilled trades would recognise that fact and not urge the acceptance of the lowest tenders, but look for the men who would do their work properly, and whose work, because best done, was certain to be the cheapest in the end.

ECKSTEIN *v.* THE ST. PANCRAS IRONWORKS COMPANY.

THIS was an action brought in the Chancery Division of the High Court of Justice for an injunction to restrain infringement of copyright in a trade catalogue issued by Messrs. Hayward Brothers & Eckstein, of Union Street, Borough, manufacturers of pavement lights, &c., against the St. Pancras Ironworks Company, of St. Pancras Road. Mr. Marten, Q.C., and Mr. Carpmael (instructed by Messrs. Wilsons, Bristow & Carpmael) appeared for the plaintiffs; Mr. Renshaw, Q.C., and Mr. Lawson (instructed by Messrs. Faithfull & Owen) appeared for the defendants. The hearing of the case occupied Mr. Justice Kekewich for four days, and his lordship, at the conclusion of the reply on behalf of the plaintiff, gave judgment on Tuesday last as follows:—

Mr. Justice Kekewich: In this case, as now and again happens, it falls to my lot to discharge at one and the same time the functions of judge and jury, and I have found it convenient on other occasions to follow the precedent set me by Sir George Jessel in similar circumstances, and, with a view to explaining to the parties the reasons for my conclusion, and to enable me, if so wishing or advised, to review that conclusion in the Court of Appeal, to direct myself; that is to say, to express by way of opinion such directions as a judge would give to a jury if there were a jury in the box, to which had to be submitted the question of fact. I should be obliged under such circumstances to lay down the law for the jury, and in saying that I of course put aside all questions arising on the title of the plaintiff to sue. Those questions have been deferred. They may or may not hereafter be argued, but I am not touching upon them in any wise. I am not concerned with them either as judge or jury. I assume for the present purpose that the plaintiff is entitled to sue; that is to say, that he is owner of the copyright in the publication in respect of which he sues the defendants. I think it is sufficient to limit that to the catalogue of 1889. If the plaintiff fails as regards the catalogue of 1889, it seems to me that he necessarily fails as regards all else, but I must not be understood therefore as excluding that of 1885, which has been referred to by Mr. Marten in his reply, and which is present to my mind.

Then assuming for the present purposes, and not at all deciding either one way or another that the plaintiff has a title to sue, first let me consider what the action is. It is an action to restrain the defendants from infringing the plaintiff's copyright on this catalogue; in other words, from copying their catalogue. Before proceeding further, it is necessary to consider in what that copying consists—that is to say, copying which is actionable copying. A catalogue is obviously a different publication from almost any other that is conceivable. It is different essentially from a publication such as is more common in actions of copyright and which occurs to one's mind more readily, such as a book—for instance, a novel. One might take many other instances equally well, but an ordinary novel will answer the purpose. The author of a novel written in the English language has no right to the words—that is to say, unless he invents words for his own purpose, and perhaps not even then; but he has no right to the words. The creation lies in the collocation of words which express situations, which express thoughts and sentiments, and the author has a right to have that collocation of words protected. It is easy, as a rule, to ascertain whether there has been any infringement of his right. You may in another work find the accidental combination of the same words in expressing the same idea. If you find that repeated; if you find the persons the same, even though they may be called by different names; if you find the situations similar, then you are driven irresistibly to the conclusion that there has been copying—and very little, in fact, determines one in the conclusion that where the collocation of words is the same there has been actionable copying, and for the reason which I have mentioned, that you are dealing with the creation of the mind, which is evidenced by what you have before you.

Another instance which sometimes occurs, and which may be referred to as distinguished from the novel, and more nearly approaching that which we have in hand, is the dictionary.

GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

There have been actions for infringement of copyright in dictionaries. I apprehend that a man who is proposing to compile a dictionary, whether in English or any other language, is entitled to the use of all the words in that language—that is to say, English; and he is entitled to place them in his dictionary in the order in which they naturally occur, according to the alphabet—that is to say, words beginning with *Ab* before those beginning with *Ac*, and so on. It would not be any ground of complaint by the author of an old dictionary that the new one followed that order, or that it contained all the words which were in his own dictionary. If the old dictionary is a good one, the new one will contain at any rate the same words: it may contain more. One looks further, and one finds the etymological explanations traced to different dead languages or compared with other living languages. Again, that may be identical in the two dictionaries. Again, if the old dictionary is really perfect, the new one must approach, in order to be good, very near to it. Then there is another matter with which we are all familiar in consulting dictionaries—the quotations. There you get a more doubtful ground; but it certainly is competent to the compiler of the new dictionary to quote Shakespeare or other well-known authors, and if he does he would probably quote some of the same passages which have been quoted before, and it renders the task of anyone who attacks a new dictionary as an infringement of copyright extremely difficult. What you have to do in a case of this kind is, as well as you can, to say, "Has the new dictionary maker industriously used the common materials, or has he slavishly followed the example of his predecessor?" He was entitled to consult his predecessor's dictionary, of course. He would have been wrong not to do so, but he was not entitled to copy. If you could come to the conclusion on identical pages that he had really by independent industry arrived at the same result, you would be wrong in holding him to infringe the copyright, notwithstanding the identity. The question is one of independent industry, but of course when you find line after line—still more when you find page after page—identical, what is in the first place suspicion tends to become, and probably will in the end become, conviction that that independent industry has been wanting. That seems to me a sort of middle case between the novel or other work of creation and the dictionary, which is more a work of industry.

Now we pass to such a case as a catalogue. The questions respecting catalogues always arise, and do arise in this instance, where the author of the catalogue complained of has carried on, or is proposing to carry on, a business precisely similar to that carried on by the author of the old catalogue. I put aside all patent rights. I put aside all rights arising out of registration of design or anything of that kind. Therefore the tradesman or the manufacturer has a perfect right to construct, make and vend the same article that his rival, already in possession of the field, has sold before him. He may make and sell not only a similar article, but an article precisely the same. He is, of course, not allowed to sell it as otherwise than his own. He must not hold out any idea that he is selling his rival's goods. But, again, that does not enter into the present case. As long as he does not do that, he may sell the very thing or so exactly a similar thing that no minute examination will find the slightest difference between them. He must depend on the excellence of his work and upon his *clientèle* for giving him the work rather than his rival. And if he may make, surely he may advertise it. He may advertise the very same thing. There is no reason, as he may sell an article precisely the same, why he should not describe it as being precisely the same. He may have actually line by line, and, if it comes to a question of figures and describing the contents, he may have the same figures and the same contents. If he passes from that and wishes to describe, of course he must take care about what I have called the collocation of words. The same thing may be aptly described in the same language, but when he comes to letterpress, he must be careful not to use the same words—certainly not the same words in the same collocation, unless he is ready to encounter the suspicion that he has been guilty of copying. But though he may, as I say, not only sell the same thing, but advertise the same thing for sale, he must not copy his rival's catalogue. He must arrive at the conclusion by independent industry, and the sole difficulty of course, in this case as in any other, as regards the patterns, is to decide whether the defendants here have arrived at the same or a similar result by independent industry or not. I have dwelt upon his liberty to make and sell the same thing, because that seems to me of first importance. Being at liberty to sell the thing, he has the thing from which he can make his patterns; that is to say, he has, or may have, the actual thing before him. If he has not already made it, he can probably find it in the market, or he can find some example of the article already sold, and from that he may take his pattern. In this particular case it is not proved thoroughly, but there is a suggestion—Mr. Marten, I thought, complained of it—that one of the objects delineated here was really one of the plaintiff's, and made by

READING CASES FOR THE ARCHITECT.
Price 2s.—Office: 175 Strand, London, W.C.

the plaintiff, and, having been placed in Manchester, was copied by the defendants. I can see no possible harm in a rival trader, knowing that an article had been made, going to the place, copying it from the article itself, making and selling other examples of the article made exactly according to the pattern, and, having so got the pattern, reproducing it by means of a drawing in his catalogue. But he must not take his rival's catalogue and copy that. Then is he entitled to make any use of his rival's catalogue at all? I think he is. I think a manufacturer intending to issue a catalogue by way of advertisement is entitled to look at all the catalogues of all his rivals, and to consider what advantages they offer him, in what form they are to tempt the public, what their colours are, and so forth; and I see no objection to his determining to include in his catalogue some or all of these articles which he finds described in one or more of the other catalogues. But, again, having done that, and being at liberty to do that, he must not copy anything. He must use (I repeat the phrase) independent industry; and again, if you do find, on minute examination, such similarity—particularly if that similarity is repeated in several instances—as makes one suspicious that there has been copying, that suspicion may be readily increased into conviction, and the copying may be held to have occurred without proof, beyond that repetition of exact similarity that there has been a copying in fact.

Those are my views respecting the liberty of the rival intending to issue a catalogue. Having said so much about that, I do not propose to go at great length into the particular instances in this case, and I am dealing for the moment only with the patterns or pictures. As regards one about which much has been made, the sketch on the outside of the defendants' catalogue, I confess that I think now, as I thought when Mr. Garnham gave his evidence, that what he said put the plaintiff out of court. He was the first expert witness, as well as the only expert called by the plaintiff—a man called to show how precisely similar the defendants' pictures are to those of the plaintiff's; and he said, in terms which did not, to my mind, admit of any doubt, that he placed no reliance on that, on the question of similarity or dissimilarity. But that there might be no mistake about it, I called the plaintiff's counsel's attention to it on the spot and at once, but I really got nothing to contradict Mr. Garnham at all. But my own eye tells me that there are great differences between them, and that the differences seem to me to be in points of substance, whereas the similarities seem to me to be in points of less importance, always bearing in mind that this is an article which is common to the trade—that is to say, which can be made by the two, and therefore I think also described by the two. Therefore I put that aside.

Now one word before I go on as to the evidence, and this applies not only to the pictures, but to the rest of the case. I am not dealing here with any question of honest and dishonest witnesses, because if the question is to be discussed elsewhere it is right that the judges of the Court of Appeal should know how I regard the evidence. Mr. Eckstein is of course a deeply-interested witness. Mr. Pye Smith is the same, and so is, I think, Mr. Halford. I must regard him as interested as well. Therefore of course I treat the evidence of all those gentlemen with that care and drawback which is right whenever you are dealing with the evidence of an interested witness. But subject to that one remark, I think that I am bound to treat them all as desiring to give their evidence honestly, and to put their views and the facts within their knowledge before the Court fairly. There were some witnesses called on behalf of the plaintiff, a gentleman who came to tell us what the view of the trade was as regards these patterns. I do not pay much attention to that. Far be it from me to throw a doubt on their honesty of purpose or the straightforward character of their evidence, but they did not condescend to details. They took a particular view. They knew Haywards, they were not sympathetic with the defendants, and they regarded the defendants as intruders who were robbing the plaintiff of his established position, and their evidence was rather tinged by that kind of feeling towards him, and therefore their evidence is of less weight. As regards all the others I say it is not a case of disbelieving anyone, only weighing the evidence as well as one can.

That being so, what conclusion ought I to arrive at as regards the different patterns without going through every one of them? Now it seems to me, according to the evidence, that in every instance there was some material, at least, outside the plaintiff's catalogue. The plaintiff's catalogue was avowedly consulted, and according to my view the defendants had a right to consult it, but I do not think it was followed—that is to say, not beyond this, that the defendants intended to present to the public a catalogue illustrating and advertising articles of a similar character to those which the plaintiff had already advertised and was selling. I think that in every instance there were materials beyond that. How far Mr. Pye Smith, in making his sketches, had the plaintiff's catalogue before him, how far he drew it from his recollection of that catalogue, how

far he made those sketches from his recollection of the articles, or had the articles before him, it is difficult, perhaps impossible, to say. But I think where he made sketches there is not the slightest evidence to show that he copied the plaintiff's catalogue, and where he did not make sketches I do not think the evidence goes to show that instructions were given by him or by Mr. Halford directly from the plaintiff's catalogue. I think they were sufficiently independent to enable their draughtsman to draw quite independently of the plaintiff's catalogue. Then in many cases I know that there were either castings or wooden patterns or pieces of castings, something in a concrete form before them, and that they drew from them. On the whole, I think that the defendants acted fairly in that matter and endeavoured to make patterns which were their own, that they did exercise what I have already styled independent industry in the matter and to my mind they have done so with considerable success. I think when one comes to look into these things with the assistance of the evidence, it is not only possible but easy to see differences in every one of the patterns which are said to have been closely imitated. One, perhaps, on which more stress has been laid than any other, and which, therefore, I select for observation, is what is called No. 8, about which one witness made a complaint that it was No. 8. Of course, on that I do not dwell. No. 8 in the defendants' catalogue is to my eye, even without the evidence, very different from the No. 8 of the plaintiff's, and the same is in a less degree true of No. 10, which, with No. 8 and No. 9, makes a particular group. There there is more similarity, but it is only fair to observe that the pattern is of the simplest possible kind, and that there is very much less room for difference; but there is a difference, and when you come to compare them narrowly they are really not of the same sizes, the lines are different, and of course the surroundings are different. I say nothing about the words indicating the maker, because that I should not consider of the slightest importance either way.

As regards the rolling basement-lights there is certainly more difference than in the one, No. 10, to which I have just been alluding. One can see at a glance that there has been much introduced, and if you compare not only the rays of light but the wheels and the character of the wheels, without professing to enter into any question of mechanics, one sees that the artist here has introduced something entirely different. Then the only other one forming a separate group by itself is the cellar-flap. There there is a different point of view, as proved by the sketch which was handed up yesterday, and which, on the other hand, as Mr. Marten has pointed out, is not so different as at first sight appears. But there are there again very great differences, whether you look at the open cellar-flap or the shut one. It is sufficient to point out for the present purpose the glass, which is entirely different, in the one case being a flat and in the other case being a prism, and looked at in an entirely different way.

Now before I part with this there is one which I ought to refer to on an entirely different line, and that is the pavement-light which is made smooth for indoor use, but may be made rough, and it has been argued that a pattern in a catalogue, which is there represented to be rough sufficient to stand the wear and tear of outdoor use, may be copied by a similar one made smooth for indoors. If you could prove the fact of copying, that may or may not be so, but you must prove the fact of copying; and to my mind there is no proof here, and everything short of that goes to show that there has not been any infringement here of the plaintiff's rights. I ought perhaps to have mentioned that in passing on to No. 8 before going to the last one.

Then I pass on now to some matters which are not so much covered by my preliminary observations, and that is the letter-press made up really of the figures. I shall not say anything about the sections which I think follow what I have said about the patterns. As regards the figures there is some difficulty, and it is the part of the case which most impressed me in Mr. Marten's opening, and which has required more care than anything else. I leave out the superficial area, which is an introduction of the defendants' and which is not attempted to be complained of in any way. The plaintiff conceived the idea of grouping the patterns in a sort of schedule to each picture under heads of three or four, so as, I am told, to catch the eye; so that looking down for a moment under No. 15, "No. of lenses in length," 4, 5 and 6 are printed together, then there is a break, then 7, 8, 9 and another break, and then 10, 11 and 12. So that you have a grouping of nine things taken three together. That I think has been copied by the defendants, but I cannot see the slightest harm in their so doing. It is an idea. It is a mode of catching the public eye and so tempting the public attention, which does credit to the plaintiff in these days of advertising ingenuity. But why no one else should do the same I do not understand. If the plaintiff's case is sound at all as regards that, it follows that a man who desires to advertise, say, musical instruments, shall not group his violins or any other articles that he has to sell in that way—that the idea of group-

ing them in little lots of three or four so as to catch the eye is the plaintiff's own property and cannot be copied by anyone else. I mean that if the plaintiff is right in that at all he is right not because the defendants are rivals in his own trade, but because he has a copyright in that grouping. To my mind it is quite impossible that he should have any such right, and I dismiss that.

Then come the figures. It matters not for this purpose which you take, but in each case there is, against the particular example which has a certain number of lenses in length, placed the length and height of the article having a certain number of lenses in height, and then going on varying and increasing the number of lenses in height along the row, so that you get a continuous multiplication of figures making the superficial area in each case. It is said that the defendants have copied that. I am not saying anything about the "stock sizes" or the right of the plaintiff to protect that at all. That is one of the questions of law which Mr. Renshaw has reserved, and which he may not have occasion to argue hereafter. I will assume that the plaintiffs, if they can show that there has been slavish copying in that, that is to say, that there has been no independent industry, can protect their description. Have they shown a want of independent industry? Or, rather, to put it the converse way, have not the defendants shown that they have exercised independent ingenuity? I think they have. I think that they have shown that they did all that was necessary. They knew that the plaintiff had done this; they knew that other persons had done this, but of course it has not been proved, and it could not be proved really, that in every single case in all these hundreds of instances the calculation was exactly made, either by Mr. Pye Smith or by Mr. Halford or by any one else. But the evidence goes, to my mind, to show that with rare exceptions the calculation was exactly made, and I am by no means satisfied on the evidence that the calculation was not made in every instance. I do not think it has been proved to me that in any instance it was not made.

That brings me directly to the one case to which Mr. Halford refers in his affidavit, and which he was cross-examined upon to-day, and which Mr. Pye Smith also gave evidence upon. As regards some particular numbers, the defendants admittedly have taken what they called the arbitrary sizes of the plaintiff's. That applies particularly to No. 1 pattern on page 7 of the defendants' catalogue. It is said also to apply to 16, 17 and 18 in that pattern and elsewhere. The 16, 17 and 18 have no doubt been taken from the plaintiff's to this extent. They had not been common in the trade as far as catalogues were concerned before this. The plaintiff had been selling sizes 16, 17 and 18, and therefore they were introduced into this catalogue for the first time, except so far as the plaintiff had already introduced them. But we have it in evidence that these things were sold, and if they were sold there was no reason why they should not be catalogued and advertised, and therefore I fail to see any blame attaching to the defendants for having added them to their catalogues.

Then, again, as regards this, I think, on the evidence, there is some confusion from the use of the term "arbitrary sizes." It may be, and I do not say it is not the case, that what was said about the adoption of arbitrary sizes does not apply to 16, 17 and 18, as well as to some other items, particularly in No. 1 pattern. It may be so, though I am not by any means certain that it is so. Now, what is the meaning of the defendants adopting the arbitrary sizes of the plaintiff? I understand it to be this. The plaintiff has taken certain sizes—certain lengths and depths—and multiplied them together for the purpose of ascertaining the superficial area, and has not brought out the same result as would be brought out by the actual calculation made as it appears to have been made by the defendants, and yet the defendants have taken the same arbitrary sizes of the plaintiff. And why? Because they said, "It is known in the trade; we shall only introduce confusion to our own detriment, because nobody will have anything to say to us if we make ours a little larger when other makers make them smaller." The motive is, of course, not of the very highest character, but I do not understand that the defendants arrived at that conclusion without calculation. If I did I should think that in this particular instance there had been some copying. But I do not understand that at all. My construction of the evidence is that they looked into the matter and then adopted what was mathematically wrong to a small extent for the reason which I have mentioned; and that is what is meant by adopting the arbitrary sizes.

As I have already said, there is some confusion in the evidence on the point, and it may be that I have not thoroughly understood it; but even here, where there has been I think some departure from strictest rules which ought to govern persons under these circumstances, I do not think that there has been the want of a deliberate exercise of independent industry. If there has been copying in one sense of the word there has not been servile copying. There has not been copying without calculation—without a desire to see whether it is

right or wrong—and I think I ought to say, though the event has not occurred to my mind, that if I found some slight copying of figures, a few inches here or there, in a catalogue of this kind, I should not be disposed to grant the plaintiff relief, provided that I was satisfied that on the whole independent industry had been honestly exercised. A case has been quoted to me to show that even the slightest copying would be sufficient to give the plaintiff a title to relief. I do not understand that case—Mr. Justice Chitty's decision I should rather say, because the point does not appear to have been mentioned in the Court of Appeal—as going so far as the plaintiff would wish to push it. I do not think, in a number of figures of this kind, that if it could be proved, as to my mind it has not been proved, that the defendants had taken here and there a few figures carelessly, having tested many others and having found that many others were right—if, for instance, their agent or clerk, who was instructed to test any particular point, had shirked his work and simply copied another catalogue, I should not think that that was enough to give the plaintiff a right to an injunction, if I thought that on the whole the catalogue was the result of independent industry. Without going further into it I think that that independent industry is shown. That a great deal of it is not only not copied but is absolutely novel one's eye tells one. What the merits of course of the two rival traders are I know not, and am not concerned with at all. But I think that notwithstanding that a very strong case was opened, full examination has shown that the plaintiffs were unduly alarmed, that there has been nothing here in the way of dishonesty, and that there being no dishonesty the Court cannot interfere. The result is that, without going into the questions of law, I find on the question of fact in favour of the defendants, and the usual result must follow.

Mr. Renshaw: My lord, the motion stood to come on with the trial. I ask that the costs of the action may include the costs of the motion.

Mr. Justice Kekewich: That is the action I advanced practically.

Mr. Renshaw: Yes. I see according to the endorsement on my brief the motion was to come on with the trial. I shall ask that the costs of motion be included.

Mr. Justice Kekewich: Yes; I think you will get them without more, Mr. Renshaw.

Mr. Renshaw: I think perhaps I should, but I thought I had better mention it. I do not know whether your lordship will allow the costs of the shorthand notes?

Mr. Justice Kekewich: I am afraid I cannot. You should have thought of that before.

Mr. Renshaw: We did not make an arrangement, but they have been a good deal of use.

Mr. Justice Kekewich: Perhaps they were wise—they saw clouds ahead.

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

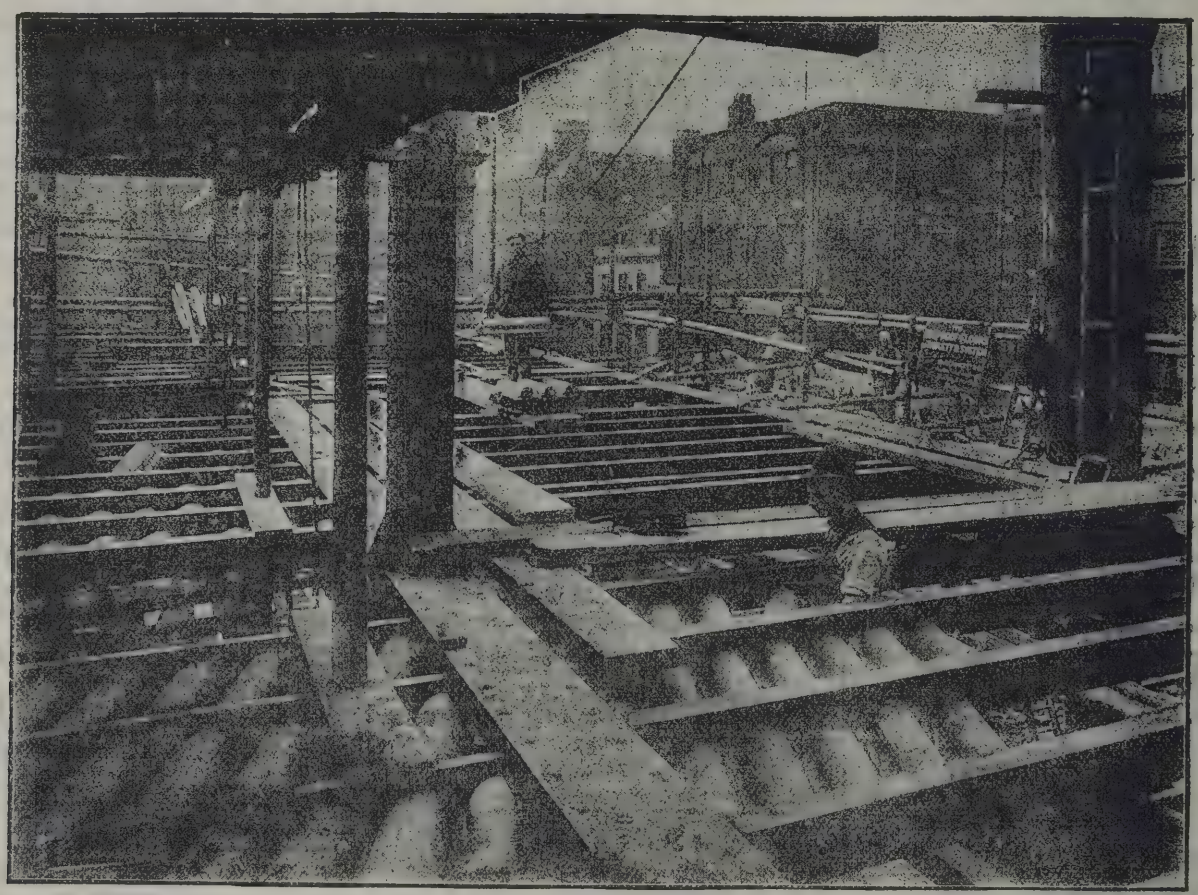
CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH,** thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.



Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special Terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

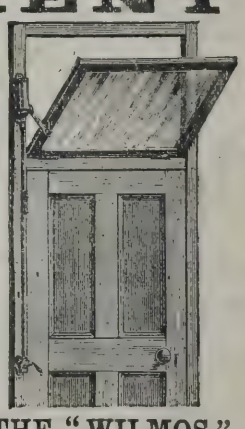
If you have not already received our REDUCED PRICE LIST, dated August 1, 1890, please write for one.

W. & R. LEGGOTT,

MAKERS OF PATENTS & SPECIALTIES,

235 High Holborn, W.C.; 109 Hope Street, Glasgow; and Silens Works, Bradford.



Telegraphic Address: "SILENS, BRADFORD."

Estimates given for Continuous and Special Openers.

CAN DESPATCH ON RECEIPT OF ORDER.

STOCKS ALWAYS ON HAND.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards, no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists, Illustrations and Testimonials, write as below. For Continuous and other Lights, Estimates given.

VARIETIES.

IN the Cross-Country Railway Bill authorisation has been given for an iron viaduct, about as high as the clock tower at Westminster, to cross from the hilltop at one side to the hilltop on the other side of Monsal Dale—one of the most picturesque of the Derbyshire dales.

THE Leith Dock Commission propose the construction of a reclamation wall, a deep water wet dock, a dry dock and the deepening of the entrance channel, at an estimated cost of over 340,000*l.*

A FIRE has taken place which has resulted in the entire destruction of the Glenburne Hydropathic Establishment, the largest and finest institution of the kind in Scotland. The structure belongs to a limited liability company, and the damage is estimated at 50,000*l.* The directors have resolved to proceed at once with the rebuilding of the establishment as soon as the valuators have done their work.

THE death is announced of Mr. Barber Hopkinson, of Keighley, founder of the firm of Barber Hopkinson & Co., land surveyors, at Bridlington, where he had been staying for the benefit of his health, aged seventy-one years.

THE Continental Gallery in Bond Street is at present occupied by a collection of works by M. Jan Van Beers, an artist who has gained some notoriety, but who is amongst the most dexterous of modern painters. At the inaugural supper the gallery was illuminated by 575 incandescent lamps, fitted up by Messrs. C. Mellier & Co., art decorators, Margaret Street, Cavendish Square, who have obtained a reputation by the beauty of their work and the expedition with which it is accomplished. Mr. W. Lowry was the superintending engineer.

CANTERBURY is to have a new seaside suburb, and Whitstable, the town of "natives," a formidable rival, in the new building estate of Tankerton, which is now being rapidly bought up by builders who can recognise an eligible place when they see it. Further sales of building plots will be held during next month.

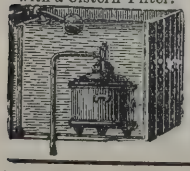
BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.



We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE
LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870, The *Lancet*, January 12, 1867.
Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.
Price, £1 10s. and upwards Portable Filters on this System, £1 5s. to £3.
Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. C

THE Local Board of Holbeach, South Lincolnshire, have rejected a tender by the Gas Company to light the streets, and have decided to use oil lamps, as being more economical.

THE death has just taken place of Mr. M. D. Goodwin, J.P., and ex-provost of Motherwell. Mr. Goodwin was a member of the firm of Messrs. Goodwins, Jardine & Co., bridge builders and engineers. At the age of twenty-two he came to Motherwell, and entered into partnership with the late Mr. John Topping, the firm carrying on business as engineers and bridge builders under the name of Topping, Goodwin & Co. Shortly afterwards the amalgamation of the Motherwell works with those of Mr. Goodwin's brothers in Ardrossan altered the title of the firm to James Goodwin & Co., Mr. M. Goodwin acting as managing partner.

IN connection with the Aberdour-Inverkeithing water dispute, pending in the Sheriff Court, at Dunfermline, Sheriff Gillespie issued an order appointing the defendants (Inverkeithing Town Council) to lodge a minute stating whether they are willing to make arrangements with the North British Railway Company to have the effect of the flow of water to the company's tank at Inverkeithing upon the flow at the Aberdour meter tested by actual observation.

THE old and picturesque hostelry, the White Hart at Penkridge, a half-timbered building, has been well restored according to the opinion of archæological visitors. The hostelry is the property of Messrs. W. Butler & Co., Limited, and they have rebuilt the frontage of the house pretty much upon the old lines. Queen Elizabeth, in one of her royal progresses, stayed a night at the mansion.

A MEETING has been held to protest against the proposal of the West Derby Local Board to erect works in Rathbone Road for the destruction of the refuse of the whole township. It was stated that there was any quantity of land in the centre of Tuebrook on which the destructor could be erected, and the cartage to that ground would be cheaper than to any other point in the district.

THE Duchess of Albany has expressed her intention of being present on Saturday, July 25, to present the certificates awarded to ladies on a course of lectures on "Domestic Hygiene" at the Sanitary Institute.

THE Bangor City Council have been authorised to borrow 4,400*l.* for extension of their gasworks. At the monthly meeting an account was submitted showing that the profits on the gasworks in 1889 were 509*l.* 9*s.* 1*d.*, and the loss on the waterworks 310*l.* 16*s.* 11*d.* In 1890, the first year in which the reduction in the price of gas took effect, there was a loss of 484*l.* 6*s.* 3*d.* on the gasworks, and on the water 125*l.* 13*s.* 8*d.*, the loss on the former in 1891 being 435*l.* 8*s.* 2*d.* and on the latter 165*l.* 7*s.* The losses were reported to have been more than made up by the contributions from the rate.

AN inquiry has been held in the Mayoress's Parlour, St. Mary's Hall, Coventry, into the application of the City Council for sanction to borrow a loan of 14,000*l.* for the erection of new baths in Priory Street. Messrs. Spalding & Burgess, London, have prepared the plans.

IT was stated at the meeting of the Alloa Burgh Commissioners that the Water Bill, after a considerable amount of difficulty, had been safely passed by the Parliamentary Committee, and that forthwith 10,000*l.* would require to be paid to Lord Mar for the valuable rights he had signed over to the Commissioners. The total cost of the new supply to the town is roughly estimated at 50,000*l.*

A PRELIMINARY report of the proposed scheme for "social homes for young men" has been issued. It is hoped to provide rooms for those young men in the Metropolis, whose interests are being studied at an economical rate, while securing a sufficient return from the scheme to constitute it a sound commercial undertaking. At the same time the scheme has been devised to afford young men the advantages of a residential club, combined with the privacy and comfort of a home, including cheerful and comfortably-furnished private sitting-rooms and bedrooms, library, reading, writing and lecture-rooms, dining-rooms and recreation-rooms.

BUILDING AND BUILDERS.

A NEW Wesleyan church has been opened at Westbury Park, Bristol. The architect is Mr. H. D. Bryon, of College Green, Bristol. The design is after the Early Decorated style. The exterior walls are faced with hammer-dressed Pennant stone, with Coombe Down stone dressings, the roof being covered with purple Bangor slates, and the ridges will be finished with red terra-cotta cresting. The chancel has a rich glazed encaustic tile pavement, specially designed by the architect, and laid by the well-known firm of Maw & Co. The stone-carving was entrusted to Messrs. Davey & Bushell. Mr. T. R. Lewis was the contractor.

Plans have been passed by the Musselburgh Dean of Guild Court for the erection of a chapel at Loretto. The building, which will accommodate about 400 persons, is the gift of the old boys of Loretto. The cost will be about 3,000*l.* Mr. Honeyman, Glasgow, is the architect.

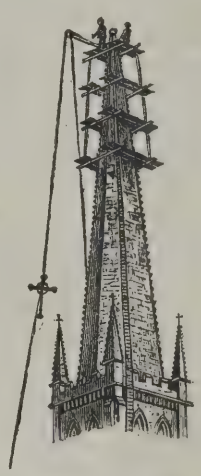
The foundation-stone of new workhouse buildings for the Grantham Union, which comprises upwards of fifty parishes in the counties of Lincoln and Leicester, has been laid. The site comprises 6½ acres, and with the buildings, when completed, will cost 25,000*l.* The contractors for the buildings are Messrs. Hodson & Son, of Nottingham. Mr. V. Green, of Grantham, is the architect. The buildings are to be in the "Pavilion" plan.

The erection of a new chancel to St. Andrew's Church, Wolverhampton, has begun. The contract for the work is in the hands of Mr. H. Lovatt, and the total cost is estimated at 2,800*l.*

It is proposed to build a new church at Gurnard, Isle of Wight. The cost, according to the plans prepared, is estimated to be about 1,200*l.*

The General Purposes Committee of the Bolton Corporation on Thursday evening approved of the recommendation of the Library Sub-committee that a library should be erected on land at the south-west corner, Town Hall Square, and plans with estimates relating to the project will be laid before the next meeting of the Library Committee. The committee's estimate of cost is 2,500*l.*, but, the *Bolton Chronicle* says, it is very questionable whether a building worthy of the borough and really adequate to its requirements can be put up for this sum.

The Walsall Board of Guardians have accepted the tender of Mr. Boden, of Wednesbury, for alterations and sanitary improvements at the workhouse for 759*l.* One of the guardians objected to the extension scheme, arguing that there had been a wasteful expenditure of money in the purchase of the land at the back, and that the better plan would be to erect another workhouse elsewhere, the present building being inconvenient and not in a suitable locality. The tender of Messrs. James Allan & Son, Glasgow, for the supply of the external staircase, for the sum of 193*l.*, was also accepted.



The foundation-stone of a public school at Leith, of which Mr. George Craig, of Leith, is the architect, has been laid. The total cost of the school is estimated at about 18,000*l.*, and among the contractors for the work are :—Builders, Messrs. A. & W. Fingzies ; slaters, Messrs. W. & S. Christie ; plumber and gasfitter, Mr. T. M'Pherson ; painters, Messrs. Haddon & Son—all of Leith ; with Messrs. W. & J. Watson, Edinburgh, in charge of the carpenter and joiner work.

A complimentary banquet has been given to Major W. V. Morgan, chairman and treasurer of the London Homœopathic Hospital, in recognition of his services to the institution. The Major was congratulated on obtaining 26,000*l.* for the rebuilding of the hospital on its present site, and a further amount of 4,000*l.*, necessary to make up the total of 30,000*l.* requisite for the new building, it was stated would be placed in his hands.

NEW CATALOGUE.

A new catalogue has been issued by the Midland Wire Cordage Company of the Orchard Works, Vincent Street, Balsall Heath, Birmingham. The question of protecting buildings from lighting has for long engaged the attention

of the company, and the works they have carried out have been to the complete satisfaction of their clients, all works being carried out by skilled workmen under their personal supervision. Mr. William H. Davison, the managing partner, is also consulting electrician.

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

AMERICAN NOTES.

ONE of the features proposed for the World's Fair at Chicago is a casino and pier. The casino, which will stand out in the lake 1,000 feet from the shore, is intended to reproduce Venice on a small scale in Lake Michigan, and has been designed by Messrs. Burling & Whitehouse, of Chicago. The building, which will comprise an area of 180 feet by 400 feet, will be built on piles, and connected with the shore by a pier 80 feet wide. It will consist of nine pavilions, two storeys in height, and, with the exception of the central one, 80 feet above the surface of the water. The centre pavilion will be 180 feet high. There will be communication between the nine pavilions both by gondolas and bridges. Surrounding the central pavilion will run a gallery 56 feet wide. The pier connecting the casino with the shore will form a broad promenade. In front of the casino will be a harbour for small pleasure craft; at night this harbour will be lighted by incandescent lamps sunk beneath the surface of the water on floats.

THE fine arts exhibit, it is now definitely and finally settled, will be at Jackson Park, the strong effort which was made to have it located in the Lake Front Park having been defeated in the Directory. The fine arts building, which will cost about 600,000 dols., will stand in the northern portion of the grounds, and will be nearly surrounded by the buildings of the several States of the Union.

A PERMANENT art palace will be built also in Lake Front Park, towards the erection of which the Exhibition will contribute 200,000 dols. During the Exposition this building will be used by the World's Congress Auxiliary for the holding of some of its numerous congresses. After the fair the Chicago Art Institute will take possession of it and make it the home of a permanent art collection.

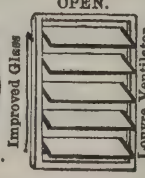
COMMENTING on the failure of the railway bridge of the London, Brighton and South Coast Railway Company, the *Engineering News* of New York says:—American engineers, and Americans who could lay no claim to the title of engineer, have built some bridges in the past which deserved criticism, and received it, too. But as knowledge has increased, many errors have been rectified and great improvements have been made. Not all American railway bridges are what they should be by any means, but on our principal lines, at least, we believe that no bridge is kept in use without some sort of knowledge of its strength, and we doubt if there is a single bridge on an important American railway as treacherous as was this ill-designed cast-iron structure on one of the principal railways of England, the failure of which is remarkable chiefly because it did not occur many years ago.

TRADE NOTES.

UNDER the superintendence of Messrs. C. F. L. Horsfall & Son, architects, of Halifax, a handsome reredos has been erected in Warley Church, near Halifax, by Messrs. Jones & Willis, of Birmingham and London. The central panel is a spirited carving representing the Lord's Supper, the grouping being that of the famous fresco by Leonardo da Vinci. The figures are carved, in very high relief, in oak, of which wood the framework is also built. This consists of an elaborate canopy of seven arches, with crocketted gables above in the Early English style. A battlemented mould runs between the gables, the spandrils being filled with carving. The canopies are supported by columns at the end, flanked by buttresses terminating in crocketted pinnacles. The side wings form a framework for the Decalogue, Creed and Lord's Prayer, which are painted upon the wood, the panels being filled in with tracery of a simple character.

A DRAINAGE scheme has been proposed for Ayr, having for its object the concentrating of the sewage of the south side of the river in a single outlet, instead of its being deposited on the beach by seven outlets as at present. The work is estimated to cost about 8,000*l*. The proposal is to carry the sewage out to sea a quarter of a mile beyond the south pierhead. At present it is stated that there are 100 sewage outlets into the river on both sides between the mill-dam and the south pierhead.

A DESTRUCTIVE fire has taken place at the works of Messrs. C. Hindley & Sons, cabinetmakers, in Erskine Road, Regent's Park Road, N.W. Messrs. C. Hindley & Sons write that, notwithstanding the fire at their cabinet factories, their machine shops and stock of timber were saved, and work has already been resumed in temporary premises.



AT the meeting of the Walsall Town Council the General Purposes Committee reported that, having had under consideration the report of Mr. F. Brown, of the Walsall Electrical Company, on his recent inquiries in America as to the working of tramway lines there with electric motors, to be supplied with

electricity by means of overhead wires, they recommended that, subject to arrangements being made by the company to the satisfaction of the committee as to the terms and conditions upon which poles shall be placed in the public streets, and overhead wires shall be carried along and across such streets, and cars run on the tramways by electricity, the consent of the Council be given to the company working these lines by means of overhead wires, and that the committee be authorised to employ an electrician to advise them as to the conditions and terms to be imposed upon the company. Alderman Evans proposed the adoption of the recommendation, and stated that Mr. Brown was completely satisfied with what he saw in America, and the fact that town after town, to the extent of hundreds, had adopted the system. Mr. Powell seconded the proposition, giving particulars of the proposed arrangements, and the recommendation was agreed to.

ON August 6 Messrs. E. & H. Lumley will sell at St. Helen's Park Hotel, Hastings, a number of lots of valuable freehold building land in St. Helen's Park. It is not so many years since this part of Hastings was a tract of country made up of green fields, vales and hills; and the rapid conversion of the country-looking spot into a populous suburb with a charming park is evidence of the attractions the locality has for residents.

THE new schools, Warrington, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

WE are informed that Messrs. Chambers & Co. have removed from 41 Bishopsgate Street Without to extensive premises, No. 90 Worship Street, E.C., where they show a carefully-selected stock of stoves, ranges and mantelpieces, also builders' and general ironmongery of all descriptions.

AT the monthly meeting of the York City Council it was reported that Mr. Leonard Bottoms, the contractor of the new sewerage works under contract No. 2, had ceased operations and had paid off his workmen. Mr. Bottoms having broken his contract, the committee recommended the Council to accept the tender of Messrs. S. & E. Bentley, of Leicester, at the sum of 69,387*l.*, with certain small allowances. The committee had given notice to Mr. Bottoms and his sureties that the Corporation would hold them responsible for any loss which they might be put to in consequence of the works which Mr. Bottoms tendered for costing more than his contract price. Mr. Bottoms had served a writ upon the town clerk, claiming (1) damages for breach of his contract, (2) for 3,500*l.* for work and labour done and materials supplied, (3) an injunction. The town clerk had entered an appearance to the writ on behalf of the Corporation.

A REPORT of the Gas Committee of the Stafford Town Council has been adopted. It contained recommendations that contracts should be accepted as follows:—Railway weigh-bridge, Messrs. Pooley & Son, Liverpool, 112*l.*; river bridge, Messrs. Eastwood, Swingler & Co., Derby, 285*l.*; retort-house roof and lattice girder, Messrs. Rubery & Co., Darlaston, 269*l.*; telescoping gasholder, Messrs. W. R. Renshaw & Co., Stoke-on-Trent, 1,443*l.* 10*s.* The committee also recommended that tenders be obtained for the erection of brickwork and ironwork for new coal stores. The committee received thirteen tenders for telescoping the No. 3 gasholder, the tenders varying from about 1,500*l.* to 2,600*l.* Messrs. Renshaw & Co.'s was the lowest. The committee received twenty tenders for the lattice girder, and twenty-five tenders for the construction and erection of ironwork for retort-house roof. Messrs. Rubery & Co.'s tender was the lowest. Twenty tenders were received for the supply and erection of river bridge. Messrs. Eastwood, Shingler & Co.'s tender was not the lowest, but being a firm accustomed to large railway work, the committee thought it well to place the order with them.

THE local district council, Bristol, in connection with the National Registration of Plumbers held an examination at the Merchant Venturers' School, when the candidates attended from Bristol, Bath and various parts of Gloucestershire and Wilts, and were examined in the theory and practice of the trade. Sixty per cent. of the candidates succeeded in passing the full examination qualifying for registration. The examiners were Mr. T. S. Pope, architect; Messrs. S. Sydenham (Bath) and J. H. Holbrook, master plumbers; Mr. T. J. Edmonds, journeyman; and Mr. Walter H. Perry, assistant hon. secretary.

THE Bradford Town Council have accepted the tender of Messrs. A. Broxup & Son for the erection of a retort-house (exclusive of roofing) at Birkshall Gasworks for the sum of 4,390*l.* The chairman of the committee explained that the supply of gas was not equal to the demand. In December 1888 the consumption of gas was 192 million cubic feet; in 1889 it was 205 million; and in 1890 it was 217 million. It was proposed to put down retorts only as they were required, and before the building was filled two or three years would have to

elapse. Up to the present time the Birkshall works had cost 154,225*l.*, and the maximum quantity of gas which could be produced in one day was 2¼ million cubic feet; but when the second portion of the works was complete they would be able to produce 3 million cubic feet, and as this second portion would probably be finished for 55,000*l.*, the cost of the production of gas would be largely reduced.

CONTRACTS for streets and other works have been accepted by the Streets and Buildings Committee of the Edinburgh Town Council:—Stewart's Granolithic Company—Tantallon Place pavement, 79*l.* 7*s.* 1*d.*; Sciennes Hill, 117*l.* 3*s.* 9*d.*; Morningside Road, 142*l.* 5*s.* 10*d.*; Rose Street Lane, 106*l.* 11*s.* 3*d.*; and Belford Road, 61*l.* 14*s.* 7*d.* Works in connection with the public sewer, William Street—James Morrison & Son, 568*l.*; sewer works, Lower Gilmore Place—R. Wallace, 115*l.*

THE volunteer drill-hall, Dumfries, has been lighted by Messrs. Milner & Son, of Edinburgh, by means of Wenham regenerative gas-lamps, with the approval of the architect, Mr. A. B. Crombie.

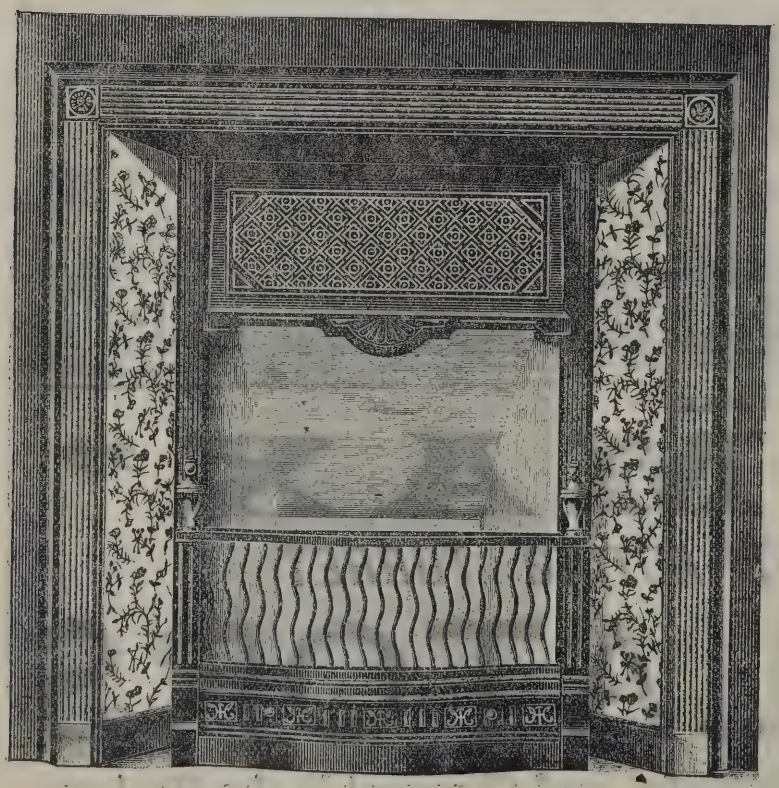
THE tender of Mr. Wilson Hartnell has been accepted for the providing and fixing of fittings required in the lighting by electricity of rooms in the Municipal Buildings, Bradford, for the sum of 630*l.*

THE Perth Gas Commission have resolved to borrow 1,000*l.* for three years, at 3½ per cent., in connection with the extension of the works. In reply to Treasurer Dewar, Bailie Bridges, Convener of the Works Committee, said that they were now within 600*l.* or 700*l.* of their borrowing powers, but they would not require to borrow any more.

The Plans and Works Committee of the Edinburgh Town Council recommend that the main staircase in the Municipal Buildings should be continued lower down the block in order that access might be had to the town's property below, which it is intended to utilise as offices. The cost will be 680*l.*

TWO or three years ago Mr. E. Pritchard, C.E., of Birmingham, was instructed by the Municipality of Cape Town to report upon the best means of sewering the district and disposing of the sewage. Mr. Pritchard prepared a report in which he recommended a sewerage scheme with a large carrier for conveying the sewage to a point in Table Bay where it could be discharged into a current of water constantly setting out to sea. Mr. Pritchard was asked to adopt certain modifications, which included a much shorter carrier. He, however, demurred on the ground that it would lead to the pollution of the bay. The result was that nothing was done. Ultimately, however, an appeal was made to the Government, who appointed Mr. Clement Dunscombe to investigate the subject. That gentleman has made a report. Although it makes no mention of Mr. Pritchard's report, the recommendations it contains are practically identical with the scheme proposed by Mr. Pritchard, the *Cape Argus* of June 24 says:—"It is very hard on Mr. Pritchard, to whom we owe at least a recognition of his sound judgment in the scheme of his which was rejected, and there is all the more reason why we should accept substantially the same scheme when it comes to us recommended by an engineer of Mr. Dunscombe's standing."

THE stair-treads manufactured by Messrs. Mason & Co., Barbican, E.C., have been designed for durability, with the advantages of being fixed with ease and simplicity and affording a firm foothold. They are formed of a combination of chilled steel and lead, fibre or any non-slipping substance, and it is claimed for them that they are cheaper than anything of the kind at present in the market.



AFRICAN MISSION AND TRADING STATIONS.

THE Livingstone Committee have been endeavouring to devise a healthy house for Central Africa, and have sent out tons of galvanised iron roofing, the freight of which into the heart of Africa far exceeds the original cost. As the result of a conference of experts in Glasgow, Mr. Binnie has drawn up the following suggestions, which are now being carried out by the artisans and missionaries on the spot:—

1. The Site.—The whole space to be covered by the house should be raised two or three feet above the surrounding ground. The lower part of this raised platform should be formed of large stones; the upper part of small stones blended with gravel, and made suitable for a brick floor. Let a trench be dug round the house near the edge of the raised platform, say three feet wide by one and half or two feet deep, with channels cut to carry off any water that may collect.

Note.—Where stones suitable for the raised platform cannot be obtained, the site of the house should be thoroughly dried by drains not more than six or seven feet apart and one and a half to two feet deep, formed by filling the lower part of a trench with small stones, these drains to run into the trench above described.

Robert Crosthwaite,
Ironfounder,
153 Queen Victoria Street,
LONDON, E.C.

PATENT No. 2496. A.D. 1884.

2. Floors to be formed of hard-burned bricks of a large size, grouted with lime or cement.

Note.—As lime is difficult to be got and costly, only a little will be available, but whatever is used should be good—one part of lime to three parts of sharp sand. Poor lime is worthless.

3. Walls to be of hard-burned bricks, a course at the level of the floors to be built with good lime.

4. Roofs to be of galvanised corrugated iron, carried on wrought-iron bound couples and purlins. One class of roofs to be for houses 38 feet wide, another set to be for houses 18 feet wide; in both cases the roofs to be one foot wider than the houses are over the walls, to allow through ventilation under the iron sheets and over the mat ceilings mentioned below. The larger roofs should have verandahs on each side eight feet wide, and the smaller roofs verandahs six feet wide. These should be kept open to admit of through ventilation.

5. The verandahs will require to be supported by posts. These need not be very strong, and possibly some of the kinds of wood not attacked by white ants may be available. If wood subject to the attack of the white ants is used, the posts should be set on sheets of tin or large hard-burned bricks.

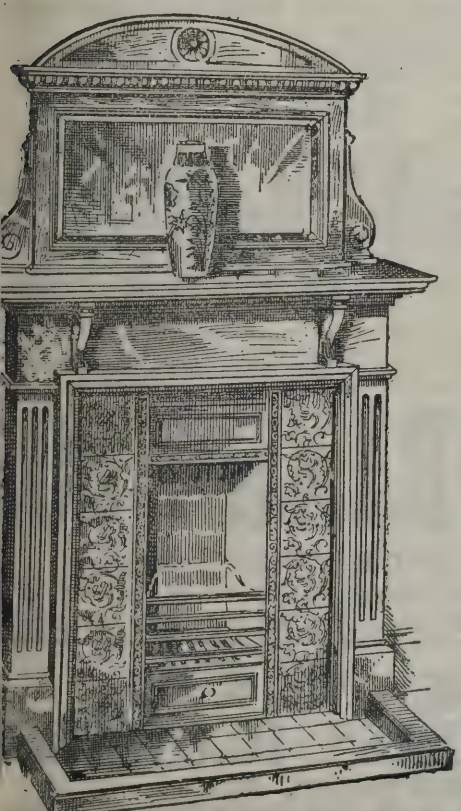
6. Ceilings.—The ceilings of the various rooms to be formed of native mats.

7. Fireplaces should be provided in all rooms for ventilation, even when they are not used for heating.

8. The main couples of the roofs should rest on large flat stones built in to the top of the walls. As a good deal of weight will be concentrated at the points where they rest, the building of the walls should be done with special care at these places.

LIVERPOOL WATER-SUPPLY.

IN the arbitration case before Sir John Coode in the action of Messrs. Monk & Newell, contractors, against the Liverpool Corporation for the construction of the tunnel under the Mersey, Mr. Hawksley, who was examined, was recalled. He said that since he was examined he had read the evidence of Mr. Deacon. It was not correct, as stated by Mr. Deacon, that the plan for the water scheme was his own with some modifications suggested by witness. The statement of Mr. Deacon as to the scheme had surprised him. The whole scheme was his and not Mr. Deacon's. He recollected the record of the borings made in 1881 being sent to him in 1882. The plan was not prepared for the purpose of being submitted to the Board of Trade, but for the purpose of carrying out the work. The design was never departed from. It was sent to Mr. Bower, the then chairman of the Water Committee, in order to show him what would have to be done under the altered circumstances. From that design a cartoon was made for Parliamentary purposes, and in September 1882 he wrote a letter to the chairman of the Water Committee stating that he thought that they would have to drive to a considerable depth, that in his opinion it was essential that the tunnel should go down to the red sandstone, and that the cost would be 70,000*l.* or more.



Cross-examined by Mr. Balfour Brown, witness said it was when the Bill was before Parliament that it became evident to him that they would have to go deep owing to the opposition of the Manchester Ship Canal Company and the Warrington Corporation. In consequence of that opposition a clause was inserted in the Bill to the effect that they would have to go to a depth to be prescribed by the Board of Trade. It then became evident that they would have to go a considerable depth into the silt. The Board of Trade would not allow the Corporation to lay the pipes at the depth they had shown on the Parliamentary plan. It was after that that he desired borings to be made in order to inform his mind as to the real nature of the strata below the surface. The Corporation went to Parliament with the idea they would be permitted to lay pipes in the trench of the river, but they were not allowed to do so.

Re-examined: The clay, as shown by the borings, was very liable to contain pockets of sand, which sand would bring in water from the river.

Mr. Francis Fox, C.E., Westminster and Liverpool, having given evidence to the effect that he and his brother, Sir Douglas Fox, were joint engineers for the construction of the railway tunnel between Liverpool and Birkenhead, described the nature of the strata through which they passed in doing that work, and said they never had occasion to use compressed air in connection with it. He visited the works at Fidler's Ferry in December, 1889, and found the shaft full of water. From what he saw he thought the contractors were trifling with the matter. The machinery was entirely inadequate, and of a wrong shape altogether. The pumps were of a wrong description, and he did not think the compressed-air apparatus was of the best kind.

Sir Frederick Bramwell, C.E., said he was well acquainted

with the Vyrnwy water supply. Tunnelling was always objected to on account of its expense, and that was the reason why the Corporation desired in their Bill to be permitted to lay down pipes in a trench to be cut in the bed of the Mersey. He had read the specification, and seen the drawings. There was no ambiguity about the specification. He never knew a specification which was more clear, and he certainly thought the contractors ought to have known from it what they were going to do. There was sufficient in the samples to warn the contractors that they would have to pass through water-bearing strata. It was a most imprudent thing to have taken the compressed air from the Cheshire side. If it had been permitted to remain, the difficulty which had occurred would have been got over.

Cross-examined: He still adhered to the opinion that the contract was for a lump sum, and that there was no ambiguity about the specification. As to the work at Vyrnwy, he had never seen better work. It was a credit to the Corporation and to the engineer, and would last for ever.

Mr. H. Williams, in a letter recently published, says:—I always regarded this Mersey crossing as the most difficult point of the scheme, and in my report of 1877 (which was in the hands of the Water Committee prior to Mr. Deacon's report) referred to it.

Mr. Williams, in his report, recommended bringing the water into Liverpool by means of an aqueduct. He says:—Being familiar with the geological features at the crossing point, I am able to say that the very condition of soil which presents almost insuperable difficulties for the construction of a tunnel, affords the greatest facilities for the screw-piling for the aqueduct under my scheme. Even now I am convinced that it would be to the advantage of the Corporation to abandon the present plan altogether, obtain powers for the construction of the aqueduct, and proceed at once with new works. I am convinced that to persevere on the present lines would be simply to pour the ratepayers' money into the Mersey, as the water is now pouring in. I have had special experience of the "flexible joint," which I believe I was the first to adopt at Pemberton as being suitable for a mining district, liable to subsidences. Under such conditions, and where it is accessible for frequent inspection, it is a suitable joint; but although it is my own design, I should be the last to recommend it for a submerged pipe, especially when there is an alternative method, viz., the method I designed in special reference to this Mersey crossing, which I explained in general terms in my report of 1877, and of which I still have the detailed drawings and estimates. I cannot help adding that I consider it most unfortunate for Liverpool that Mr. Hawksley's services were dispensed with at the time when they were of the utmost value. It was a mistake of the most disastrous character. I believe Mr. Hawksley's powerful assistance was needed to carry the scheme through Parliament, and that was why he was retained. But, after all, the actual construction of the works was the most vital point of all, and to take it out of the hands of experience, and turn it all over to the tender mercies of inexperience, was a mistake for which the ratepayers will have to pay, and which should be rectified without regard to private feelings, susceptibilities, or prejudices.

THE PANTILES, TUNBRIDGE WELLS.

ON Saturday, the 11th inst., application was made in Mr. Justice Stirling's Court by the representatives of the Lord of the Manor of Rusthall, asking for an injunction to restrain the Corporation from excavating or building upon any portion of the place known as the Pantiles or the Parade, Tunbridge Wells, in contravention of the provisions of an Act, 13 George II., c. 11, and also for a mandatory injunction to compel the Corporation to pull down and remove the building in course of erection by them upon the Parade and intended for use as a public urinal, water-closet and lavatory, and to properly fill up any excavations made by them upon the said ground for the purpose of such building. It appeared that underneath the Parade, which is one of the most popular places of resort in Tunbridge Wells and in close proximity to the band-stand, the Corporation had recently constructed an underground urinal, &c., and the plaintiffs objected to it on the ground (1) that it would create a nuisance; (2) that by a private Act of Parliament passed in 1739 the erection of such a convenience in this situation was expressly prohibited; and (3) that, even if it were not so expressly prohibited, the Corporation were acting in excess of their powers by excavating the soil of the street to a greater depth than they were entitled to do.

Mr. Justice Stirling, without calling upon counsel for the Corporation, said that this was a motion on behalf of two gentlemen in whom was now vested the manor of Rusthall to restrain the erection by the Corporation of Tunbridge Wells of a urinal, water-closet and lavatory under a well-known place of resort in Tunbridge Wells called the Pantiles. Three grounds were alleged in support of the application—(1) that the erection in question constituted a nuisance; (2) that it was contrary to the

provisions of a private Act of Parliament passed in 1739; (3) that, even if that were not so, the Corporation had exceeded the powers under which they claimed to act. The first point was a question of fact, and his lordship, having carefully considered the evidence, was of opinion that in its present state there was such a conflict that he would not be justified in granting an interlocutory injunction. His lordship was further informed that it was not desired to abandon that part of the case, and that there was to be a further trial of the action. The two other grounds raised questions of law, and if he thought the right of the plaintiffs was clear, he should have thought it a proper case for an injunction. Under the circumstances, however, his lordship thought it was desirable that the case should be tried out once for all. In 1890 was passed the Tunbridge Wells Improvement Act, by section 93 of which it was provided:—"The Corporation may erect and maintain or permit to be erected and maintained in any street or public place or on land belonging to them or on land belonging to any person, with the consent of the owner, lessee or occupier thereof for the time being, water-closets, urinals and lavatories for the use of the public." Under the powers conferred upon them by that Act the Corporation had proceeded to construct the convenience now complained of. Passing to a consideration of the question whether the Corporation had exceeded their powers, his lordship said that under the Public Health Act, 1875, the streets were vested in them as the local sanitary authority. They were entitled to erect conveniences of this kind. But it was said that although it was open to them to erect such conveniences above the surface of the ground, and for that purpose to excavate the ground with a view of putting in foundations, &c., yet it was not open to them to construct the building entirely underground. That was a question of some doubt and difficulty, and none the less so having regard to the broad way in which the law had recently been laid down by Mr. Justice Chitty in the case of Fareham Local Board *v.* Smith. In that case the learned judge said:—

"The road was, under the Public Health Act of 1875, a street vested in the local board, and, according to the authorities, what was comprised in the term street was not merely the surface of the road, but the soil below the surface to such a depth beneath as was required for the purpose of enabling the local authority to execute its statutory powers and to perform its statutory duties. The depth to which the board's statutory right extended below the street was not defined by the Act of Parliament, but it was ascertainable. Another way of stating the same proposition was to say that there vested in the local board the area of user of the street below its surface. The exact depth to which such user might extend obviously differed in different cases; for instance, the depth of a properly constructed sewer would in some roads have to be lower than in others. The proposition was founded on the decisions given in the cases of Coverdale *v.* Charlton (4 Q.B.D. 105), and Wandsworth Board *v.* United Telephone Company (13 Q.B.D. 905) with respect to the rights of local boards under the surface. The latter case also, in his opinion, showed that a similar and corresponding proposition might be correctly stated with reference to the zone above the surface of the road. The local authority was entitled to take so much of the zone above as was required for the due execution of its powers and the due performance of its duties. To express the matter shortly, it was the area of user which showed what was vested, and the street comprised the zone. The local board had a proprietary right in the zone above the surface, or, at any rate, had a possession of so much above and so much below as fell within the objects of the Act."

It might be contended that the Corporation had a proprietary right in the zone below the surface, and that the excavation complained of in this case was required for the purpose of enabling the local authority to execute its statutory powers and to perform its statutory rights. That, like the other, was a question of law of some difficulty; and having regard to that, and that the questions of fact could not now be finally determined, his lordship thought that the better course would be to direct the motion to stand over till the trial of the action. His lordship added that as to the third point, viz., the right to excavate, all the injury was already done, and that was an additional reason, so far as regarded that particular ground of relief, for refusing the interlocutory injunction.

ORDERS FOR EXTRAS TO SUB-CONTRACTORS.

THE remarkable action brought by Messrs. Heighway & Dupree, builders, Piccadilly, against Messrs. Kirk & Randall, contractors, was again heard at the Maidstone Assizes. Plaintiffs claimed for certain alterations and additions carried out at the Tivoli Music-hall, London, under contract with defendants. The following report is from the *South-Eastern Gazette*:—

In the year 1888 the plaintiffs had contracts with Messrs. Kirk & Randall in respect of certain work to be done to the

Café Monico, near Piccadilly Circus, and the Tivoli Music-hall, in the Strand. These contracts had proceeded to a certain extent when disputes arose between the parties as to their respective rights, and the plaintiffs in this action commenced proceedings in the Queen's Bench Division against Messrs. Kirk & Randall in respect of work done under the contracts existing between them. These proceedings were put an end to by an agreement, and it was upon this agreement that the present action was founded. The case was tried by Mr. Justice Stephen at the last Assizes, when the learned judge held that the plaintiffs' view in the matter was correct, but nevertheless sent the case to the Official Referee. This decision was carried to the Court of Appeal by plaintiffs, and it was there held that there was no case for the Official Referee at all, and the action was sent down for re-trial. The main question was as to whether the architect engaged by the Tivoli Company had power under the agreement entered into by the parties concerned to order the work, the price of which plaintiffs claimed. A jury had been empannelled to try the action, but before the case had proceeded far it was agreed by counsel that his lordship should deal with the matter in dispute, the questions involved being of a very complicated character. Evidence in support of the claim was given by Mr. C. J. Phipps, the architect engaged by the Tivoli Company, and Mr. Dupree.

Mr. Channell, Q.C., called Mr. Joseph Randall, one of the defendants, and this witness's brother was also put into the box, the evidence tending to show that all authority to order the work in question had been withdrawn from the architect, and that the extras ordered by Mr. Phipps comprised structural alterations which, even if authority had not been previously withdrawn, he had no power to order under the contract given Messrs. Heighway & Dupree, which had reference to decorative work only. Mr. Randall mentioned in the course of his evidence that he had sustained a loss of 25,000*l.* over the Tivoli contract, the company being in liquidation.

Mr. Winch, Q.C., submitted that the defendants had no power to revoke the agreement into which they entered with the plaintiffs, under which agreement he held Mr. Phipps was given full authority to order the work in respect of which the claim was made.

His lordship gave judgment for the amount claimed, 2,353*l.* He observed that plaintiffs' case was that the architect clearly had power to give the order for the work in question, that they had executed that work in good faith, had obtained their certificate, and were therefore entitled to be paid. The architect was called by plaintiffs, and he had stated that the work had been done by his authority and under his supervision, that he was perfectly satisfied with the way in which it was executed, and that in his judgment plaintiffs were clearly entitled to be paid the amount sought to be recovered. Now, for the defendants it was sought to be shown by the cross-examination of the plaintiff, and also by independent evidence, that the defendants ought not to be held to be liable. Mr. Channell's point was, he believed, that the agreement of March 6 between Kirk & Randall and the Tivoli Company was to do specific work, that there was a clear intention that there should be no extras which Kirk & Randall should be bound to do, that the plaintiffs, who were sub-contractors, were aware of that contract, and knew of the object of it, and that their contract in the month of October was entered into upon the same lines. His lordship held that under the contract entered into between the parties the architect was given full power to order the extra work in respect of which the claim was made, and that defendants could not escape from responsibility for the payment.

IMPROVEMENT OF THE DEE AT CHESTER.

THE following important report from Sir John Coode, C.E., on the treatment of the River Dee, in order that the health of the inhabitants of Chester may be protected, is at present under the consideration of the Public Health and Sewering Committees of the Corporation :—

Gentlemen,—In accordance with the instructions conveyed to me by your town clerk, Mr. Samuel Smith, I proceeded to Chester on April 9 for the purpose of examining the locality and making myself acquainted with the principal points bearing upon the matter referred to me. On the evening of my arrival I had the great advantage of a lengthened conference with the town clerk, who placed before me Dr. Ballard's report to the Local Government Board of April 1890 and his memorandum of June 1890 ; a copy of the decision of Mr. Horatio Lloyd on the question of the pollution of the River Dee by owners of certain property in Queen's Park ; analyses of the Chester water by Mr. Campbell Brown on October 6, 1890, and by Mr. Lowe, city analyst, on October 14, 1890 ; together with the annual report of the medical officer of health of the Chester Urban Sanitary Authority, Mr. Kenyon, to which is appended an analysis of the water supplied to Chester for each month of the year 1890. I should mention that the city surveyor, Mr.

Matthews Jones, was present and took part in this conference, which proved of much service in placing before me matters connected with the salient points requiring my attention.

During the whole of April 10 and up to the middle of the following day I was occupied in examining the river between the Sewage Works at Sealand, below the city, and the Iron Bridge, near Eaton Hall, and met, about the time of high-water, a few of the committee appointed to confer with me, at the Old Dee Bridge, when a memorandum asking my attention to certain points was handed to me by Mr. John Whalley. On the following day I completed such local investigations as were necessary for me to make personally, and attended, at the town hall, a meeting of the special committee nominated to confer with me on the subject generally.

Finding it requisite to obtain exact and reliable data as to the tidal range at, and above, the site of the weir, levels of land liable to flooding, &c., I sent a competent assistant, Mr. Wilson, to make the necessary local observations, which have been obtained and are now before me. Having carefully considered, with the information thus provided, the points on which my opinion is desired, I beg now to submit my report thereon. The chief questions referred to me are :—(1) The practicability of preventing the tide flowing over the weir at the Old Dee Bridge ; (2) the advisability of so doing ; (3) the probable cost ; and (4) the likelihood of its being sanctioned by Parliament.

With regard to the first of these questions, I have to state that it is quite practicable, by more than one method, to prevent the highest tides flowing over the weir.

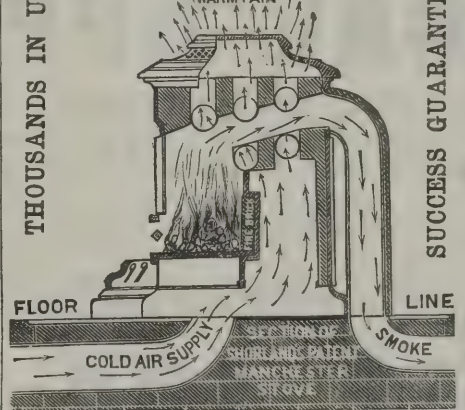
As to the second question, *i.e.* the advisability of so doing, the answer involves several considerations, the first, and by far the most important, of which is, the effect which such prevention would have upon the navigation of the Dee below the city.

It was mainly to obtain such data as would enable me to form such idea on this point that my assistant was directed to proceed to Chester. By means of the observations he was instructed to make, supplemented by others previously made in the locality, I have been enabled to arrive at a standard for comparison with the Admiralty time-tables, and thus to attain the results given below. It is, of course, to be understood in this, as in all similar cases, when dealing with tides, that the numbers and heights must, of necessity, be open to changes consequent upon the prevalence or otherwise of strong winds from the different quarters of the compass ; but, subject to this contingency, the figures given below may be accepted as sufficiently accurate for our present purpose for 1891, and indeed for any other year.

Stated in a tabular form, the number of tides that would top the Chester weir would be as follows :—To the extent of less than 1 foot, 101 ; from 1 foot to 2 feet, 51 ; from 2 feet to 3 feet, 35 ; from 3 feet to 4 feet, 19 ; from 4 feet to 5 feet, 11 ; total, 217.

We must arrive at the fact that three-tenths of the whole number of tides in the course of a year, or of any other lengthened period, flow over the top of the weir ; and further, it is important to note that practically one-half of the tides which do flow over the weir cover it to depths varying from 1 foot to 4 feet. It may be added that tides occasionally, but rarely, rise to such a height as to submerge the weir to a depth of 6 feet.

With regard to the volume of tidal water, I caused measurements to be made by my assistant on two successive days during his stay at Chester, from which I am led to the conclusion that, on the occurrence of every tide rising 2 feet 6 inches above the top of the weir, about 14,000,000 cubic feet would flow into the compartment of the river above the weir. In the absence of an extended series of observations, the expense of which would not be warranted under the circumstances, I am unable to say with exactitude what would be the volume of tidal water flowing into the compartment of the river on the up-stream side of the weir on the occurrence of a tide rising 5 feet above its crest, which, as will be seen by the foregoing table, occasionally occurs ; it may, however, be certainly taken as upwards of 30,000,000 cubic feet.



The exclusion of such a quantity of tidal water as now flows over the weir, even on a tide rising only 1 foot above its crest, would be prejudicial to the navigation of the Dee below Chester, in consequence of the reduction of the scouring power due to the loss of that quantity passing up and down twice during each twenty-four hours. I may mention in this connection that the Admiralty Commissioners, in their report of January 24, 1850, evidently entertained an opinion adverse to the exclusion of any further quantity of tidal water, inasmuch as they said, "In regard to the upper part of the navigation, we have to remark that eventually a considerable change may be affected in its character by the removal of the weir above Chester Bridge and the admission of a considerable length of tidal column."

Mr. H. E. Taylor, engineer to the Dee Conservancy Board, has been good enough to furnish, at my request, particulars, as given by the Custom House, of the shipping using the Dee,

from which I gather that the number of vessels navigating the river below Chester during the last seven years has been on the average 2,462 per annum, and the registered tonnage 190,722 per annum. Moreover, in consequence of the recent improvement in the depth of water, vessels of a larger class are now trading to Connah's Quay and the upper river than formerly.

It is evident from these considerations that the navigation is by no means an unimportant one ; it follows, therefore, that any such reduction of the present scouring power as that which I have above indicated would be seriously detrimental to the navigation of the Dee throughout the whole of its course below the city. In view of these facts, I am led distinctly to the conclusion, as regards the second question, that any raising of the weir would be unadvisable.

As regards the fourth question, I am equally decided in opinion—based on the same facts—that there is no likelihood that any raising of the weir would be sanctioned by Parliament, and I am fortified in that opinion by the circumstance that the modern and approved practice in the treatment of tidal rivers is opposed to such a raising as would be necessary to exclude the tidal water from the compartment of the river above the weir at Old Dee Bridge.

In view of what has been hereinbefore stated, I need not dwell at any great length upon the question propounded at the meeting of the special committee at the town hall on April 11. I may say, however, after having caused the land on either side of the river to be examined as far up as Lower Hall (which is the extreme limit of the tidal influence, and rather more than eighteen miles above the city), that the conclusions at which I have arrived may thus be stated in general terms :—

(*a*) If the weir were raised, the flooding of the lands above would be increased, and the various outfalls in the upper river would certainly be throttled in wet seasons, unless the tidal exclusion was effected by a series of movable sluices constructed along the crest of the weir, such sluices to be brought into play when the upland waters might so require ; but, inasmuch as the exclusion of the tidal waters could not be permitted, for the reasons hereinbefore stated, I need not enlarge upon this further than to remark that the evil consequences which would follow from the exclusion of the tide above the weir by means of movable sluices would, as far as the tidal waters are concerned, be just as great as if a solid weir had been constructed. I may say, nevertheless, that between Chester weir and the Iron Bridge there are about 460 acres of low-lying ground, that between the Iron Bridge and Farndon Bridge there is an area of about 2,400 acres, known as Trevalyn meadows, and that between Farndon and Lower Hall there is an area of about 1,250 acres, all of which would be immediately affected by flooding in a greater or less degree by any raising of the weir.

(*b*) As to the possible effect on the lower part of the town near Crane Street, I have considered this question in view of the tidal observations made to enable me to arrive at a conclusion on this point, and am of opinion that the raising of the weir would not cause any appreciable rise in the level of tide there at the time of high water.

(*c*) The raising of the weir would undoubtedly cause a considerable loss of "head" at the mills during dry seasons, seeing that, under present conditions, from eight to twelve tides during each fortnight overtop the weir, and during such seasons these tides compensate for the deficiency of fresh water in the river ; consequently the mills would be injured by the raising of the weir.

(*d*) With regard to the prevention of salmon getting up the river, if it were decided to raise the weir, the proper course would be to provide one or more salmon "ladders" by means of which this difficulty would be met.

(*e*) The effect on the navigation has already been dwelt upon.

(*f*) If the spring tides were arrested at the weir there would be occasions when some deposit would take place at the lower side, but such deposit would in all probability be scoured away on the occurrence of heavy land freshes, but it is by no means certain that the result might not be the formation of a shoal lower down.

(*g*) In the event of the weir being raised, provision could of course be made for the passage of boats from the upper to the lower river, and *vice versâ*, by means of a lock, as in the case of the Upper Thames and other rivers.

It will be readily understood, in view of what I have hereinbefore said, that I have regarded it as altogether superfluous to give instructions to my assistants to work out the details of an estimate of the cost of raising the weir, that being the third question contained in the town clerk's letter to me of February 26 ult.

As to the question of the sewage from both sides of the city, seeing that the exclusion of the tide from the compartment of the river above the weir is not advisable, having regard to all the circumstances of the case, I consider that no time should be lost in adopting some course whereby the whole of the sewage from both sides of the river should be so dealt with as

to be removed to a distance from the city—indeed, as far as practicable, at a reasonable cost—and there passed through land, if such can be found suitable for the purpose, and if not, that it should be purified by chemical treatment. At any rate, in view of the fact that the passing tides must be permitted to flow over the weir for from eight to twelve tides during each fortnight into the compartment of the river whence the water supply for the city is drawn, the effluent from the sewage farm or works (as the case may be) should be brought to the highest possible condition of purity. Whether, even when this may have been done, it will be expedient to continue to draw the supply for the city from the present intake, or whether resort should be had to a more unexceptionable source, opens up a large question, and is a matter upon which I do not understand that I am asked to express an opinion.

It only remains for me to state, and I have much pleasure in so doing, that your city surveyor, Mr. Matthews Jones, rendered me every assistance that I desired during my own personal inspection, and I have to thank him also for the facilities afforded to my assistant whilst he was engaged in the locality.—I am, gentlemen, your obedient servant,

JNO. COODE.

RAILWAY VENTILATING SHAFTS.

THE Second Division of the Court of Session have reversed a decision pronounced in the Dean of Guild Court, Glasgow, and authorised the North British Railway Company to proceed with the erection of a ventilating shaft in West Regent Street. The Dean of Guild refused the lining craved, and dismissed the petition, holding that the proposed shaft was in contravention of the conditions in the feu contract, in respect (1) of being greatly in excess of the height of buildings allowed to be erected, (2) as proposed to be erected of brick instead of stone, and (3) for a purpose that could not but be nauseous and hurtful to the neighbouring feuars in a district which was almost entirely residential. Against this decision the petitioners appealed to the Second Division, and their lordships recalled the Dean of Guild's interlocutor, and found the appellants entitled to expenses.

The Lord Justice-Clerk said that the North British Railway Company, who had a line which ran below a considerable part of the city of Glasgow, were under an obligation enforceable by the Dean of Guild to have the underground part ventilated, and to carry out this obligation they had purchased a property not very far from Blythswood Square, and proposed to erect a ventilating shaft from the top of their tunnel running at right angles to the street, but at some distance from it, and then to erect a brick shaft for the purpose of carrying off foul vapours from the inside of the tunnel. It was not disputed that the railway company had a right to this ground, and a right to use it, except so far as they could be restricted by contract. Any question between the superior and the feuar was out of the case, because the superior did not object to what the company proposed to do, and the sole question was whether the neighbouring feuars had a right to prevent the railway company's action. Their right to interfere with one of the Blythswood feuars must be something of the nature of a servitude of a dominant over a servient tenant. There was no contract between the feuars who were objecting to this being done and the railway company, and therefore the servitude must be found, if it existed, to be imposed on the railway company by the conditions of the feu contract to which they got a right by purchasing the property from the previous proprietor. It had been very clearly and distinctly decided by the House of Lords in the case of Hislop, that where a feu charter from a common superior contained the same conditions as regarded the different feuars in a particular street or district, and where all the feuars had an interest in the observance of the conditions which were set forth in these contracts, that, notwithstanding, a feuar might have no right whatever to enforce the conditions against the other feuars unless he had a direct stipulation in the titles to do so. The result of a careful consideration of the feu contracts on this part of the Blythswood estate led his lordship to the conclusion that it had been thought advisable to give each feuar a servitude right against the remaining feuars, but most certainly, beyond what was there specified, there was nothing to touch at all the proposed erection by the railway company unless it were that they were to carry on a nauseous or hurtful business. The erection of a shaft to carry off vapours might be held to be so under this contract, but that was a totally different question, and independent altogether of the authorities. Whether, after this erection was made, it turned out to be nauseous or a nuisance to the neighbourhood which could not be put down, was a question which could not possibly be decided except upon the facts as they arose. To decide it at present was anticipating altogether what the effects of putting up the shaft would be. If it should turn out to be a nuisance, then it could be prohibited.

HINTS ON TIMBER.—IV.

American Deal.—Having in our last article on this subject described the different kinds of deal imported into this country from the Baltic, we may now go on to the same description of goods obtained from America, namely, American white and American yellow deal.

White Spruce Deal.—American white deal is the wood of the *Abies alba* or *nigra*—or in other words, spruce, or white pine logs sawn into planks, deals, &c.—and is known in the timber market as white spruce deal (or American, Canadian or New Brunswick spruce), to distinguish it from the white deal imported from the Baltic, to which it is considered to be slightly inferior both in strength and durability, though, from its being of a freer growth, it is straighter in the grain, less knotty, and can be obtained in wider and longer planks. White spruce deals, &c., are sorted into first, second and third qualities.

American Yellow Deal.—The yellow pine (*Pinus Strobus*, or Weymouth pine) when sawn into planks, deals and battens, is known in our markets as "American" or "Canadian yellow deal," and is largely used for joiners' work on account of its being exceedingly straight in the grain and free from knots, besides being easy to work and obtainable in planks of very great width, frequently running as wide as 30 inches. When wrought with the plane it is readily recognised, from the surface being covered with short, fine, darkish marks, like scratches made with the pen, in the direction of the grain.

Deals, how Classed and Marked.—Baltic planks, deals and battens are, speaking in general terms, classed in the timber market as "Crown," "Crown brack," "1st Quality," "2nd Quality," &c., down to even "5th Quality." Very few crown or crown brack goods come into the market nowadays, there being little or no demand for them for building purposes. The different classes of deals, &c., will be found to vary very much in quality, one shipper's "2nd quality" being often equal to another shipper's "1st quality" deals. Hence some shippers have become well known in the timber market for the greater care with which their goods are bracked or sorted, and consequently their names or trade marks may be safely taken as a guarantee of a high standard in the different qualities into which they are classed. The marks used are always to be found at the ends of the deals, in which position they are readily observed when the timber is stacked.

Russian and Finland deals, which are chiefly 1st and 2nd quality—the inferior qualities not being, as a rule, exported to this country—generally come unmarked into the market, or only dry stamped at their ends by the blow of a hammer, such marks being also termed hard brands, in contradistinction to the wet or soft brands marked in red paint on the ends of Swedish deals. These first and second qualities are known to the shippers as *prima* and *secunda*. Onega and Archangel deals are dry stamped with the shipper's initials or some private mark, and often with a number in addition; this number, however, does not denote the quality, but merely the number of the yard in which they were stored before shipping. In some cases, when the goods are not regularly branded, the second quality have a red mark across the ends, the first and third qualities being readily distinguished from each other. The well-known Gromoff Petersburg deals are, however, stamped with C & Co., being the initials of the shippers, Clarke & Co. Another Petersburg brand in high repute is P B (Peter Belaieff) for *prima*, and P B 2 for *secunda*.

Swedish goods are never dry-stamped or hammer-marked, but are invariably branded with letters or other distinguishing marks in red paint, stencilled on their ends. These marks are made on so large a scale that they render it very difficult to judge of the quality of the wood by mere inspection when their ends only are visible, as is the case when they are stacked in the timber yards; hence an acquaintance with the meaning of the brands themselves becomes all the more necessary. Some of the common fourth and fifth quality Swedish goods are left unmarked, but they may generally be distinguished from Russian shipments by the bluer colour of the sap wood. The first and second qualities in Swedish goods are classed together as mixed, being scarcely ever sorted separately; after which we get third, down to fifth quality. Except for temporary purposes or for rough work, such as slate-boarding, no deals of a lower quality than mixed Swedish, or, as timber merchants would term them, best Swedish, should be used for first-class work. It must be clearly understood that the term mixed is confined to wholesale transactions between shippers, brokers, &c.; the timber merchants always call the mixed best, the thirds seconds, and so on. It is necessary to remember this, otherwise one may be buying deals of a class lower than was intended.

Amongst the Swedish brands which bear a high character—of course new brands are constantly coming into the market—are the following, taking each shipper's marks from the different

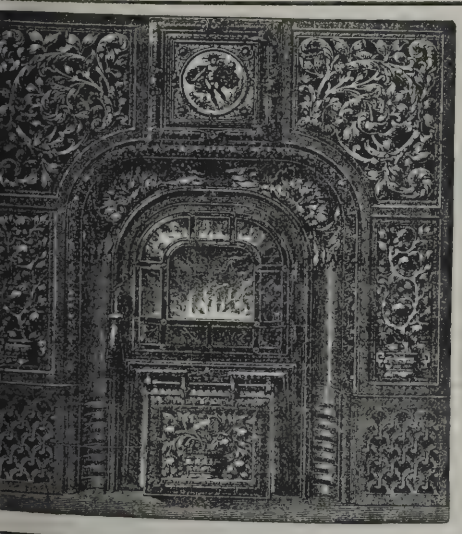
The above are but a few of the best known brands of established reputation, but a long list of all the brands of any consequence is published yearly in "Laxton's Builders' Price Book," and should be consulted by all those who wish to know the shipper's estimate of the quality of the goods he is buying, or which are intended to be used in any building under his supervision. A mere glance at the few brands here given will show how necessary it is to exercise care in reading and interpreting the brands on deals; for instance, in the case of Bergere and Berger, the simple omission of an e, which would escape the notice of any one relying on the name only, makes all the difference between mixed and third quality deals; and, again, the letters U S, when stencilled in red paint, indicate third quality, and the same letters, when dry stamped, denote mixed or first and second quality; the mixed being worth from 15 to 20 per cent. more than third quality, whilst the third quality are worth 12 to 15 per cent. more than fourth quality goods.

Norwegian marks are very numerous, but as the chief imports from Norway consist of cheap and very inferior battens (mostly 2½ inches and 6½ inches), they are not worth enumerating. From Christiania, however, some of the very best white deals come, marked H M H for first quality, and H M M for second quality. From Norway also come large quantities of cheap boards for flooring and other purposes, "matched" or grooved and tongued boarding, mouldings, doors, window-sashes, &c., prepared ready for fixing, which may often be advantageously employed for inferior and temporary purposes.



American yellow deal chiefly comes into the market in planks of various widths, which are classed as follows:—

Brights	1st, 2nd and 3rd quality
Dry floated	Ditto ditto
Floated	Ditto ditto

Their order of merit being first quality brights, then first quality dry floated, then first quality floated, after which the second quality of each description, and lastly the third qualities. "Brights" are so-called from the planks not having been discoloured by being floated down the rivers to the ports, and are, consequently, of a much cleaner and brighter yellow. The term "Dry floated" implies that the planks have, though floated down the rivers, been stacked and dried before shipment; whilst the "Floated" goods are more or less discoloured in the operation of rafting or floating down from the felling ground.

First quality yellow deals of each kind should be clean, straight grained, and quite free from shakes and knots. Second quality are a little inferior in these respects, and third quality inferior again. The floating of the deals, besides discolouring them, injures the wood considerably, causing it, from its soft absorbent nature, to warp and shake very much in drying, so

ORWEGIAN MARBLE & LABRADORITE.
LL COLOURS.] Sole Agent:—ALFRED A. HOLM. [PRICES ON APPLICATION.
owrooms & Offices:—1 PRINCES MANSIONS, Victoria Street, WESTMINSTER, S.W.

that floated deals should never be used for the finer descriptions of work. The best ports are Quebec for yellow deals and St. John for spruce deals. Goods from the more southern ports, such as Richibucto, Miramichi, Shedac, &c., are of an inferior quality. Rafted or floated deals are shipped from all the Canadian ports, except St. John; and hence the superiority of St. John deals, which are always bright and unwatered.

American goods are not branded, as a rule, though some shippers use house brands in imitation of the Baltic marks, already described, without, however, following any definite rule, such as the red paint on Swedish goods, &c.; at the same time the quality of the stuff is often denoted by I, II, or III, in red paint upon the side of ends of the planks; but the qualities of American yellow deals are easily told by inspection, the custom in the London Docks being to stack them on their sides, so as to expose their faces to view and allow of freer ventilation, which latter point is of special importance in the case of the floated deals which have been soaked by rafting down the rivers.

Deals, how Sold.—Planks, deals and battens, whether Baltic or American, are usually sold in London by the six score or long hundred (120 pieces) reduced to the Petersburg standard, which is a piece $12' \times 11'' \times 1\frac{1}{2}''$, so that the Petersburg standard hundred = 120 pieces $12' \times 11'' \times 1\frac{1}{2}'' = 1{,}980$ feet super, or 165 feet cube = 1,440 feet run of $11'' \times 1\frac{1}{2}'' = 720$ run of $11'' \times 3''$.

The Petersburg standard of 165 feet cube is that chiefly employed, but the following standards are also sometimes used:—

	Pieces.		Feet cube.	Feet super.
London and Dublin .	= 120	$12' \times 9'' \times 3''$	= 270	= 1,080
Christiania hundred .	= 120	$11' \times 9'' \times 1\frac{1}{4}''$	$= 103\frac{1}{8}$ =	990
,, ,, .	= 60	$15' \times 11'' \times 1\frac{1}{2}''$	$= 103\frac{1}{8}$ =	825
Quebec short hundred .	= 100	$12' \times 11'' \times 2\frac{1}{2}''$	$= 229\frac{1}{6}$ =	1,100
,, long ,, .	= 120	$10' \times 11'' \times 3''$	= 275	= 1,000
Drammen ,, .	= 120	$9' \times 6\frac{1}{2}'' \times 2\frac{1}{2}''$	$= 121\frac{5}{8}$ =	585

Prepared flooring boards are sold by the customary square, which is a given number of feet run, as given below, varying with the width of the board, but always so arranged as to approximate to the ordinary square of 100 feet super.

9 inch.	8 inch.	$7\frac{1}{2}$ inch.	7 inch.	$6\frac{3}{4}$ inch.
140 feet.	160 feet.	170 feet.	180 feet.	185 feet.
6 inch.	$5\frac{3}{4}$ inch.	$5\frac{1}{2}$ inch.	$5\frac{1}{4}$ inch.	5 inch.
200 feet.	210 feet.	220 feet.	230 feet.	240 feet.

THE CHICAGO EXHIBITION.

THE decision of the English Government to take part officially in the great exhibition which will be held at Chicago in 1893 was notified to the Government of the United States some three or four months ago; and we are now able to announce, says the *Times*, that the necessary arrangements have been completed. The Council of the Society of Arts will be appointed a Royal Commission for the purpose of superintending and directing the formation of the British section, and will receive a grant of 25,000*l.* towards the expenses which will be incurred. This grant is less than any previous one which has been made for a similar purpose, that for Paris in 1867 having been 126,000*l.*; that for Paris in 1878, 67,000*l.*; that for Philadelphia in 1876, 40,000*l.*; and that for Vienna, 28,000*l.* The willingness of the Council of the Society of Arts to accept a comparatively small sum is due to the experience gained at the Paris Exhibition of 1889, when no grant at all was made by the Government, and the expenses of the British section were defrayed by the exhibitors themselves, aided by contributions obtained by the Mansion House committee. Sir Henry Trueman Wood, the secretary of the Society of Arts, filled the office of secretary to the British section on that occasion; and the results then obtained convinced him, and have enabled him to convince the Council of the Society, that the Government contribution will be supplemented to any necessary extent. The authorities at Chicago will allot space to the British Commission without charge, and a certain rent will be paid by every exhibitor. This source of income alone, it is believed, will be sufficient to bring up the 25,000*l.* to the full amount which will be required for the expenditure of the Commission. Not only does the Council of the Society of Arts carry with it the prestige of the President, the Prince of Wales, and of the Chairman of Council, the Attorney-General, but it contains many members who are well qualified, alike by knowledge and by experience, to conduct the affairs of the British Section to a successful issue; while the appointment of the Council as a Commission implies also that of Sir Henry Wood as secretary, and justifies the hope that he will be able to bring about at Chicago a success as distinguished as that which rewarded his untiring labours at Paris. The appointment of a "Council," the members of which will not be mentioned by name, as a Royal Commission, is a wide departure from ordinary custom,

but in this instance it will be attended by certain advantages. The Council of the Society of Arts is a fluctuating body, some members of which retire annually to make room for others, and it is probable that the ordinary vacancies will be filled next year by gentlemen whose advice and assistance is likely to be of especial value. Whether the retiring members will lose or retain their status as commissioners is a question which the document appointing them will render manifest.

It can hardly be doubted that the Chicago Exhibition will in many respects surpass all which have previously been held; but the question still remains whether English manufacturers will, as a rule, find it worth their while to incur the trouble and the very considerable expense of contributing to the display. On this question opinions differ; and it is perhaps indisputable that, in some trades, no advantage would be likely to accrue to English exhibitors, at least as far as an American market is concerned. In steel rails, for example, Chicago can hold her own against the world. On the other hand, it must be remembered that the exhibition is likely to attract visitors from many countries, as from South America, Australia, China and Japan, and from many markets in which American and English manufacturers are now or soon may be in competition; while, even in America itself, the perhaps only temporary existence of high import duties will not induce the wealthier portions of the community to deny themselves the luxury of English manufactures in those departments in which this country stands unrivalled. In cutlery, in the finer varieties of glass and porcelain, in artistic manufactures of many kinds, rich Americans are likely for many years to be large buyers in England, and the more they see of the wares which England can produce the more certain they are to become impatient of a system which loads these wares with duties of an almost prohibitory character. Textiles should be well represented, and the many manufacturers of them who are even now contemplating the opening of branch establishments in the States would be certain, from the experience of the exhibition, to obtain valuable guidance as to the desirableness of carrying such intentions into effect. In fine art, more especially, this country should hold a foremost place, since American purchasers are already well known in English studios, and will be unable, at least for a long period, to supply their requirements with pictures and statuary of home production. On the other side of the question, it must be admitted that the distance is great, that transit will be expensive, and the trouble of management considerable. Labour also will be costly, and it is doubtful to what extent the Alien Labour Act will prevent the introduction of foreign workmen even for the better arrangement or production of foreign goods.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

11028. William Alexander Bernard, for "A parallel vice."

11064. Arthur Martin, for "Preventing draughts or dust at bottom of doors, automatically rising when door opened and falling when shut."

11068. George William Davis and Richard Southerton, for "An improvement in mathematical instruments and gauges."

11073. Thomas Niccol, for "New or improved means or apparatus for automatically closing watertight doors or valves, such as the watertight doors of ships' bulkheads."

11091. Thomas Andrew McKee, for "A new or improved means of producing enlarged or reduced scales for drawing, and also for dividing straight lines of any length into any number of equal or proportional parts."

11115. William Trebilcock, for "Improved apparatus for adjusting skylights and securing the same in position."

11154. Robert Edward Sudden, for "The prevention of down-draughts in any situation and as a ventilator, entitled the 'Combination' chimney-cowl and ventilator."

11239. Joseph Parkinson, Samuel Fawcett and Charles Frederick Parkinson, for "Improvements in ladders and trestles."

11312. Thomas Bowman Dunn, for "Improvements in or relating to window-sash lifters or handles.'

11360. Alfred Foster, for "Improvements in door locks and latches."

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of KALLKOLITH goes further than three times the same quantity of oil-colour.

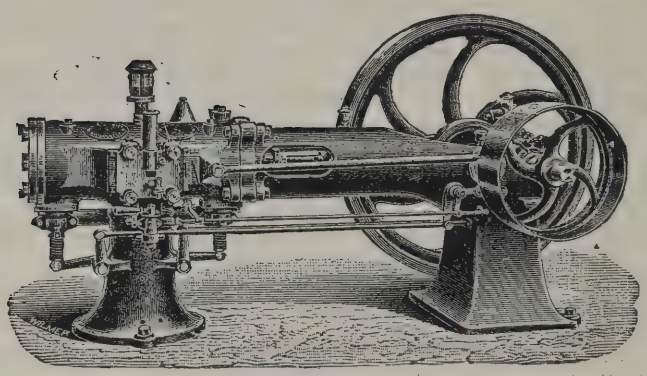
DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where KALLKOLITH is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with KALLKOLITH, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

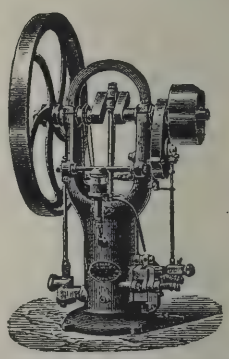
Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special Terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.



THE

"GRIFFIN" GAS ENGINE.



In the Competition for Gas Engines held by the Society of Arts,

GOLD MEDAL

Awarded to the "GRIFFIN" Gas Engine.

Horizontal Type.

Single-acting Vertical Engine,
From ½ to 4-Horse Power.

CHEAPEST, SIMPLEST, AND MOST ECONOMICAL GAS MOTOR.

SUITABLE AND USED FOR

Hoisting, Sawing, Printing, Pumping, Grinding, Mining, Chaff Cutting, Polishing, Organ Blowing, Sewing Machines, Dairy Work, Boot Making, Pulverising, Soda Water Machinery, &c., &c., &c.,

AND UNEQUALLED FOR ELECTRIC LIGHTING.

Professor JAMIESON, M.I.C.E., F.R.S., Glasgow, in his Scientific Report, says:—

"Throughout the whole of my electrical test the *Engine* WORKED VERY STEADILY; *in fact I have never before tested a Gas Engine which maintained such uniformity of speed* at full power; *no pulsation or blinking being observable in the incandescent lamps.*"

And Professor KENNEDY, F.R.S., M.I.C.E., University College, London:—

"There is no doubt that it is a most important practical advantage of the 'Griffin' type of Engine, that it can be made to accommodate itself to variations of resistance not only without alteration of mean speed, but also without alteration in the number of explosions per minute, and therefore, without any alteration of steadiness."

BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE
LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. TRADE NOTES.

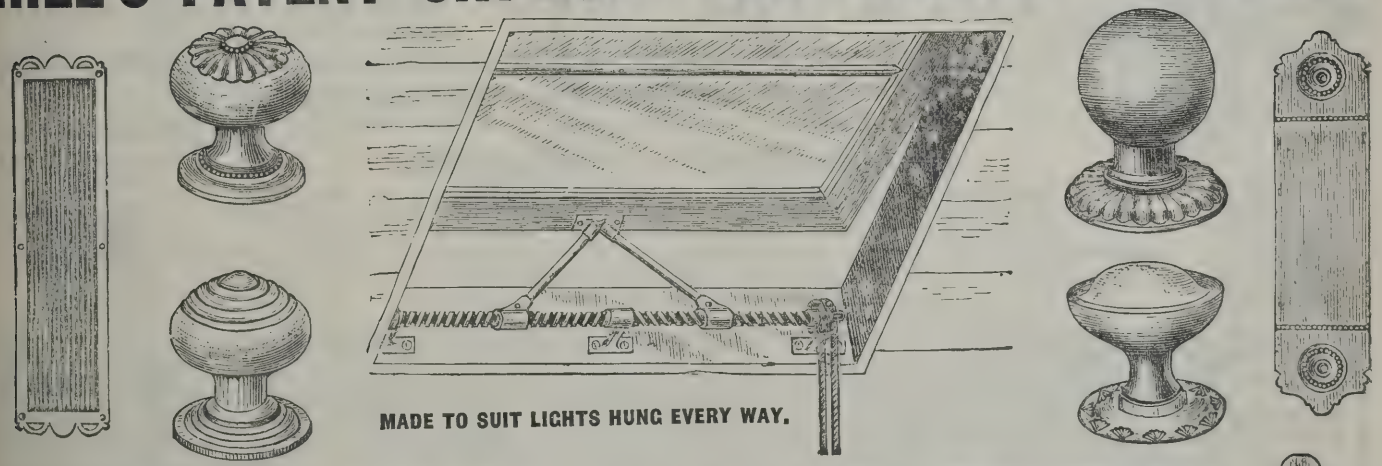
THE vestry hall of St. Martin's has been opened. Mr. C. H. Mabey executed the general carving on the building, and also the bas-relief panel at top—St. Martin and the Beggar.

ON Sunday last a new clock was started by the donor, Mrs. John Ashworth, in the tower of Astley Bridge Church, Bolton. It strikes the hours, chimes the Westminster quarters, and shows time on three dials. It will prove a great boon to the inhabitants, and will form a standard for the timekeeping of the neighbourhood. Messrs. John Smith & Sons, Midland Clockworks, Derby, carried out the work, and they have also just completed a large clock on the Victoria Pier, Douglas, Isle of Man.



THE Cottage Hospital, Gartnavel, Glasgow, is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Mr. E. H. Shorland, of Manchester.

THE Local Government Board have given their sanction to a scheme for the water supply of Oundle, prepared by Mr. W. H. Radford, C.E., of Nottingham. The decision as to the sewerage scheme is expected shortly.

ON and after August 1 the premises of Messrs. C. & R. Light, wholesale cabinet and looking-glass manufacturers, Curtain Road, will close at two o'clock on Saturdays.

THE Manchester New College was commenced some weeks ago, and is now well in hand, Messrs. Worthington & Elgood being the architects. The whole of the fireproof floors are to be constructed on Fawcett's system. Quite recently, at Lincoln, by invitation of Mr. W. Mortimer, architect, a party, including architects and members of the Corporation, had an opportunity of inspecting this system of fireproof flooring in

JAMES HILL, 100A QUEEN VICTORIA ST., LONDON, E.C.

the warehouse in course of erection for Messrs. Doughty, Son & Richardson. Mr. Mark Fawcett, who is a native of Lincoln, was present and explained the system.

THE Birmingham Corporation have just ordered a new fire-escape capable of extension to 70 feet in height, for use by the Fire Brigade in connection with the lofty buildings in the centre of the city. The escape will be constructed by Messrs. Shand, Mason & Co., of London, on their patent "lattice girder" principle. A similar escape, 60 feet in height, has also been ordered for Leith, to replace one destroyed at the recent disastrous warehouse fire. Another 60-feet escape was recently supplied to Derby, and when publicly tested gave great satisfaction. Thirty seconds suffice for its extension to the full height by two men.

EXTENSIVE additions and alterations have been made to schools for the East Ham School Board, and the most careful consideration has been given to the ventilation, which has been entrusted to the "Climax" Ventilating Company, of 15 Great George Street, Westminster, whose appliances, both for admission and extraction, are adopted throughout.

THE tender of Mr. Thomas Coates, Durham, has been accepted for the execution of works required at the Government buildings in Durham.

THE committee of the Bolton Technical School, after special inquiries and investigation into the various gas-engines in the market, have decided to accept the estimate of Messrs. Dick, Kerr & Co., Limited, of Kilmarnock and London, the makers of the "Griffin" double-acting gas-engines. This is the best type of a double-acting engine, and is particularly steady in running. There is an explosion at every revolution and a half, first on one side of the piston and then on the other, insuring great regularity. It is of the greatest importance to have the steady running, especially for electric lighting, and the consumption of gas in these engines is as small as in the best single-acting engines. Two engines are required, each to indicate thirty-five horse-power. One will be used to work the machinery and the other the electric lighting, but they will be so arranged as to be worked separately for either purpose, so that any accident to either engine would not completely stop any part of the work of the school. In addition to the large engines a three horse-power engine will be provided and serve as a starting-engine for the large ones, and also will be available for use when it is required to run only a small portion of the machinery. This will enable students to use some of the machinery for special purposes without the necessity of running the large engines.

AT the meeting of the Eccles Local Board, it was resolved to take advantage of the power given them by Parliament (in connection with the Salford Gasworks Extension Bill) to promote a Bill next session for establishing separate gasworks for the supply of the district jointly with Swinton and Pendlebury. It is said that if the scheme is carried out, the Salford Corporation will claim 200,000*l.* compensation for loss of custom and value of gas mains in the joint districts.

WITH a view to alterations which it is intended to carry out in the Glasgow Sheriff Court-House, committees of the Court-house Commissioners and the Faculty of Procurators have held a meeting to discuss a scheme which would give satisfaction to law agents and litigants. A satisfactory arrangement, it is expected, will involve the reconstruction of the courts and sheriffs' rooms.

VARIETIES.

IN consequence of the successful termination of a negotiation by which the "Theodora" Company has acquired the option of a long lease of the New Olympic Theatre, Mr. W. W. Kelly, the manager, has decided to abandon his intention of opening the Globe Theatre next Thursday for a tentative season, and has arranged to revive "Theodora," with Grace Hawthorne in the title *rôle*, at the New Olympic Theatre, on Saturday, August 1 next.

AT the annual meeting of the Paisley Town Council as the Gas Corporation, the financial statement for the year ending May 28 was submitted. The gross revenue for the year amounted to 39,120*l.* 19*s.* 10*d.*, and the gross expenditure to 27,799*l.* 18*s.* 3*d.*, which left a balance of profit and loss to the extent of 11,321*l.* 1*s.* 7*d.* After setting aside 3,082*l.* 5*s.* 11*d.* for interest on mortgages, &c., and also for sinking fund, there was left a net surplus of 8,238*l.* 15*s.* 8*d.* It was proposed to reduce the price of gas from 2*s.* 10*d.* for 1,000 cubic feet to 2*s.* 8*d.*, in which case Paisley would have the cheapest gas in Scotland. It was decided, however, that the price should remain at 2*s.* 10*d.* to enable important and necessary improvements to be continued in the town as heretofore.

WITH the July number the *Art Decorator* has begun its third annual series. It contains "Emblems of Great Artists," viz. Dürer, Holbein, Michel Angelo, Raphael and Rubens;

"Wood Inlay," designed by F. Flinzer; a lunette, "The Vine," by Professor G. Sturm; polychrome friezes in Italian Renaissance style, by Professor Seubert; and two decorative landscapes, by A. Wirth, the whole being designs in colour for the amateur and art worker.

THE Lund Park, a new park at Keighley, named after Mr. James Lund, of Malsis Hall, who gave 15 acres of land to the town, has been opened.

THE site for the new general post office in Victoria Street, Liverpool, contains about 8,300 square yards, and is situated near the centre of the chief business part of the city. The greater portion of the site is unbuilt upon, the remainder being covered with buildings which are mostly unoccupied, leaving only a small part occupied by traders. It is believed that the cost of acquiring the site and erecting a suitable building will not exceed 400,000*l.*

PLANS have been submitted by Messrs. Browett, Lindley & Browett to the Eccles Local Board for the erection of new engine works at Higher Croft, Barton, near Manchester.

A MEETING has just been held of the Fife and Kinross Lunacy Board, at Cupar, when another discussion took place over the estimates for the proposed new hospital. The contractor's schedules had been carefully overhauled so as to cut down the cost to the lowest point. The result was a reduction on the previous estimates of 2,070*l.*, which brought down the net total to 20,630*l.* Lord Elgin pointed out the evils that would arise from delay and the impossibility of getting any further light on the question, as the whole subject had been fully discussed during the last fourteen months. He was also surprised at Mr. Welch's criticisms on the difference between the real and the probable estimates. Any one who had had any experience in building knew it to be invariably the case that the actual cost exceeded what was at first expected. It was decided to proceed with the building.

THE magnificent collection of classical antiquities from the site of the Temple of Diana, Nemi, Italy, presented to the Nottingham Castle Museum by Lord Savile, G.C.B., F.S.A., late H.M. ambassador at Rome, has been formally opened by the Mayor of the borough, in the presence of a distinguished company. In the absence of Lord Savile, through ill-health, he was represented by Mr. Felix Joseph, who, at the banquet which followed, responded for the toast of his health in very eulogistic terms, and commented on his many benefactions to the country.

A PROJECT is under consideration at Runcorn and Widnes to connect the two towns by the erection of a vehicular bridge over the Mersey. Sir Douglas Fox has drawn up a scheme for a bridge over the Mersey at a cost of 140,000*l.* It is proposed that the gradients on each side should be 1 in 30, and that the bridge should be constructed at an elevation of 75 feet above the high-water mark. This will be about 10 feet lower than the present railway and foot-bridge of the London and North-Western Railway.

AMERICAN NOTES.

THE Chicago *Journal of Commerce* says borers of the city artesian wells at Fort Worth, Tex., are of the opinion that the drill will soon penetrate a huge volume of boiling water, as the temperature increases with every few feet they go down, and at last accounts was 121 degrees at a depth of 2,900 feet.

IN excavating at Nimroud, the New York *Times* says, a number of drains were found covered over with pointed and elliptical arches, each layer being built slanting, so that it rests on the one immediately beneath it. This method of building renders a timber-centre or scaffolding unnecessary to support the stones until the keystone is in place.

THE current number of *Stone*, Indianapolis, contains an article on the sandstones of New York.

WHAT is said to be the first as well as the biggest tree that has ever been hauled on a railroad, is the trunk of a yellow fir-tree, weighing 90,000 pounds, to be exhibited at the World's Fair, Chicago. The tree as it stood in the forest in the Snoqualmie Valley, near the Cascade huts, and sixty miles east of Seattle, Wash., was 225 feet high and over 5 feet in diameter at its base. In the tree there are 23,000 feet of lumber, and from the rings at the butt it shows itself to be 441 years old. In the run from the West it has been exhibited at Tacoma, Portland and Omaha, and in spite of the immense tarpaulin which covers it it is chiselled, carved and marked with the names or initials of half the population of the West.

ACCORDING to *Stone*, Indianopolis, Mr. A. J. Gerstel, of Chicago, advocates granite paving for carriageways of that city. He says:—"I favour granite above everything else. Some people claim it is too smooth, and that dust arises from it, but you know that granite is everlasting, and that is what you want on our busy streets. I do not favour brick on a street where there is constant and heavy travel. Brick will not stand the

wear. I see some people favoured asphalte for a time. That was an absurd idea. No responsible company would put in a plant to lay asphalte streets unless they were assured of fifteen or twenty miles of work. It costs not less than 5,000 dols. to establish such a plant, and no responsible company would put it in unless they saw work enough ahead to warrant it. If you want to see asphalte streets, go to St. Joseph, Mo. They had them. The company put in a plant and patched up the holes for two or three years. Then they packed up the plant and left. In European cities where asphalte is used extensively you will see barrels of pitch on all the streets, and men are constantly at work repairing breaks." Mr. Gerstel, or his informants, evidently have little acquaintance with asphalte carriageways out of America, as will be seen on reading the last sentence above.

THE Hudson River Tunnel has, the New York *Engineering News* says, about reached the lowest point in its total length of 5,500 feet. A 2 per cent. ascending gradient is now to be followed, and Messrs. A. Pearson & Sons, the contractors, have obtained from the War Department permission to cover the comparatively thin layer of silt, that would otherwise cover the tunnel roof, by a bed of well-tempered clay. The present depth of water at this low point is from 60 to 64 feet, and in some cases there are only 5 feet of river mud between the tunnel roof and the river bottom. As the air-pressure now used is about 25 lbs. per square inch, and this would have to be increased, it is evident that the shell of mud is not sufficiently thick to hold it. To go deeper into the river-bed means rock excavation, an exceedingly difficult and dangerous operation with the present plant. The Board of Engineers has granted the application on condition that not more than 20,000 cubic yards of clay be used in all, and that the clay bank nowhere rises more than 15 feet above the present bottom, nor anywhere above 31½ feet below low-water level in the river. This material must also be removed to the original depth on the completion of the tunnel. The company must also give a bond of 200,000 dols. for the faithful performance of their work under the above conditions, and pay for any damage to piers.

THE Census Bureau has issued statistics showing the extent and value of the limestone industry in the United States. The table of production shows that 19,095,179 dols. worth of ordinary limestone was produced during the census year from 1,954 quarries by a force of 30,644 men, to whom 10,121,985 dols. was paid in wages. The total expense of producing the limestone amounted to 15,092,714 dols., indicating a profit to the producers of over 4,000,000 dols. The capital invested amounts to 27,022,325 dols., of which 14,771,200 dols. is invested in land. The various purposes for which it is used is shown as follows :—

Building purposes	$5,405,671
Converted into lime	8,217,015
Stone for burning into lime	184,024
Flux for furnaces	1,569,312
Street work	2,383,456
Bridge, dam and railroad work	1,289,622
Miscellaneous uses	46,079

The figures are limited to lime manufactured by producers of limestone, and do not include lime produced by limeburners who purchase stone from quarrymen and burn it into lime. Limestone is produced in thirty-nine states and two territories, but nearly two-thirds of the product is confined to seven states. These seven states are Pennsylvania, Illinois, Indiana, Missouri, New York, Maine and Ohio, and the value of the product in each is in the order the states are named. Pennsylvania leads the list with 373 quarries and a production valued at 2,655,477 dols., as will be seen from the following table :—

Pennsylvania	373	$2,655,477
Illinois	104	2,190,607
Indiana	172	1,889,336
Missouri	123	1,859,960
New York	157	1,708,830
Maine	60	1,523,499
Ohio	221	1,514,934

These are the only States in which the value of the product reaches 1,000,000 dols. annually. In Wisconsin the value is 813,963 dols.; Minnesota, 613,247 dols.; Iowa, 530,863 dols.; California, 516,780 dols.; Kansas, 478,822 dols.; Alabama, 324,814 dols.; Kentucky, 303,314 dols. Maine heads the list in the value of lime produced, yet Pennsylvania produces more than twice the quantity produced in Maine. The Maine product comes entirely from Knox county, where large quarries of very pure limestone are operated exclusively for conversion into lime. Pennsylvania produces 4,043,679 barrels of lime, while the production of Maine is 1,903,639 barrels. The value of the Maine output is 1,523,499 dols., while that of Pennsylvania is only 1,195,955 dols. A large proportion of the lime produced in Pennsylvania is used for agricultural purposes which requires only inferior grades, whereas the lime from Maine is almost entirely used for building purposes in many of the principal cities on the Atlantic coast.

THE BATTERSEA POLYTECHNIC.

ON Monday the Prince of Wales laid the memorial-stone of the Battersea Polytechnic, in the Battersea Park Road, the first of a series of polytechnic institutes proposed to be erected in London, and endowed under schemes prepared by the Charity Commissioners with funds arising from the City of London Parochial Charities Act, 1883. It is proposed that two of these institutes shall be erected south of the Thames (the other being in the Borough Road), in addition to the institute of the Goldsmiths' Company at New Cross, which the Prince opened on Wednesday. The institutes in the Borough Road and Battersea will be under the control of their own governing bodies, which will include representatives of the County Council and the London School Board, with the controlling influence of the central governing body of the City of London Parochial Charities and the Charity Commissioners. No intoxicating liquors are to be allowed, and the institutes are to be placed on an unsectarian basis. The cost of the buildings is estimated to be 40,000*l.*, and land and fittings will bring the total cost up to 60,000*l.* The bulk of the money has been provided in three generous donations, one of 20,000*l.* by the late Mr. Guesdon, of Clapham, and two of 10,000*l.* each by Mr. Henry Tate and Mr. Frank Morrison. All classes in the locality have, however, taken an interest in the scheme; collections have been made in workshops, funds have been raised by concerts, the children of the Board schools have contributed their mites, and the total amount raised is within 9,000*l.* of the total sum required. The site in the Battersea Park Road is some two and a half acres in extent, and is held on lease for 91½ years from Lady Day, 1886, but it is proposed to acquire the freehold. On the whole 60,000*l.* being raised, an endowment of 2,500*l.* a year will be secured, 1,500*l.* a year being already secured, payable when the work is commenced. It is intended that building operations shall be commenced shortly.

The plans of the institute have been prepared in competition by Mr. Edward Mountford on the basis of a report prepared by Mr. Rowland Plumbe, F.R.I.B.A., as to the requirements of a polytechnic, which in its turn was submitted to the criticism of experts. Mr. Mountford's plans were submitted to the criticism of Professor Garnett, principal of the Durham College of Science, Newcastle-on-Tyne, at whose suggestion certain alterations were made. The buildings will stand some 40 feet back from the road. In the elevation the effort has been made to give what is recognised as a distinctly collegiate character, consistent with educational purposes. The materials to be used are red brick and terra-cotta. There will be a main block with two or three annexes. The main block, fronting the Battersea Park Road, will be 260 feet in length and two storeys in height. The ground-floor will be occupied by the administrative department. Upon the first floor will be class and lecture-rooms, band and music-rooms, and above these will be art schools, photographic-rooms and various laboratories. The shops will include bricklayers and plumbers' shops, engineers' and turning shops, a pattern-maker's shop, carpenter's shop, electric workshop, and dynamo, boiler and engine-rooms. There are also to be social and refreshment-rooms for both sexes, with separate entrances. At the back will be gymnasia and a swimming bath. Economy in the working of the building led, it is understood, to Mr. Mountford's plans being preferred. Though there are to be three entrances, they may all be commanded by one attendant in the centre of the building. As the inauguration of the scheme took place only some three years ago at a meeting at the Mansion House, there cannot be said to have been undue delay in the raising of so large a sum of money.

METROPOLITAN SEWERS.

ACCORDING to Mr. Crawford Barlow the evidence given in connection with the ventilation of the Houses of Parliament brings into prominence a danger which, if not soon dealt with, will produce very serious consequences through the whole of the metropolis—that is, the overcharging of the sewers during storms.

The evidence given by the district-surveyor of Westminster was to the effect that during the storm of July 8 the low-level sewers in the vicinity of the Houses were fully charged. That this is the case in the majority of the sewers of the metropolis (especially those near the river) during every heavy fall of rain is a well-known fact to those who have had occasion to study the evidence of such investigations as have been made—for instance, the Royal Metropolitan Sewage Discharge Commission, 1884.

The evils resulting from this are twofold—first, as the increased volume of liquid enters the sewers the sewer-gas is forced out, and all the ingenious traps and other contrivances which modern hygienic knowledge has devised cannot resist its pressure, and the gas enters the houses with results which are too well known to need description; secondly, as the main

outfall sewers are unable to carry off this enormous volume of liquid, "storm outlets" have been constructed, which discharge a liquid composed largely of sewage-matter from the sewers direct into the river in the heart of the metropolis. There were in 1884 forty-eight of these outlets, and since then others have been constructed; and as the volume of this liquid increases even faster than the population, and others will have to be constructed, it follows that the river is being more and more charged with crude sewage, and in course of time will arrive at the condition it was in before the main-drainage works were commenced. This result was foreseen by Captain (now Sir Douglas) Galton and Mr. Simpson, who then reported "that the limited provision for rainfall in the sewers proposed would cause the sewage to frequently overflow into the Thames within the metropolitan districts." The remedy for these evils is to construct special conduits for carrying the rain-water off all roads, open spaces, public buildings, &c., direct into the river, and thus leave the sewers for conveying away sewage, refuse of manufactures and the rainwater off private houses. These conduits might be constructed at a moderate cost and with practically no disturbance of the surface of the roads, if the system of construction adopted, first at Tower Subway, and still later at the City and South London Railway, were used. Such an arrangement would not only entirely remove the dangers above referred to, but also considerably reduce the annual expenditure now incurred for pumping those large volumes of liquid from the low to the high-level sewers, a fact which will (if the dangers do not) appeal to the ratepayers of London.

CITY TRAFFIC.

IN the preliminary report on the Day Census of the City, submitted to the Court of Common Council by Mr. James Salmon, the chairman of the Local Government and Taxation Committee, and adopted, it is stated that the census of street traffic was taken on May 4, the result of the twenty-four hours' counting being—

	1891.	1881.
Persons entering the City on foot or in vehicles	1,121,708	797,563
Vehicles	92,488	71,893

These particulars were collected at eighty inlets, as compared with sixty inlets on the last occasion, and consequently required a larger staff and increased supervision. It is almost impossible to grasp the idea that over a million persons flock daily to this centre of the world's commerce; but still more striking is the fact that during the last ten years the increase has been 324,145—a growth approaching one-half of the number in 1881.

Full details are in course of preparation showing the numbers at each separate inlet. These will appear in a subsequent report. Meanwhile it may be interesting to note, and it will assist us to comprehend, the marvellous increase of incomers, if I give an illustration drawn from the traffic at the cluster of railway-stations in Liverpool Street:—

	1891.	1881.
G.E.R., Liverpool Street	52,413	33,890
N.L.R., Broad Street	43,042	30,444
Met. Ry., Bishopsgate	13,180	9,325

The vehicular traffic shows an increase of 20,595. I am having prepared a table setting forth every class of carriage and the number in every hour. It will be seen that though at all times during the day the traffic is great, yet there are certain periods of extra pressure when, but for the admirable arrangements of our police, our streets in many places would become impassable. In connection with this matter, many questions may arise in the future concerning the cost of paving and of street improvements, and I therefore have given especial attention to these returns of traffic.

VENTILATION OF HOUSE OF COMMONS.

THE Select Committee appointed to inquire into the ventilation of the House of Commons have finished taking evidence, and will meet again for the consideration of their report. It is believed that they will recommend alterations in the existing apparatus involving an expenditure of about 6,000*l.*, their principal suggestions being the enlargement of the air inlets and the provision of gratings and double windows in the committee-rooms. In foggy weather all air admitted to the House is passed through cotton wool, with fairly satisfactory results. It is not improbable that the committee will recommend the adoption of the same system in a somewhat modified form throughout the session. The committee are reported to be strongly of opinion that the impurities at present noticeable in the atmosphere come from outside the House, and it is possible that the London County Council may be urged to take some steps in the matter.

HOLBORN IMPROVEMENT.

THE London County Council have just received a memorial from numerous ratepayers of Holborn, Southampton Row, and the adjacent neighbourhood, stating (1) that the traffic of Holborn is seriously impeded by the cross traffic emerging from Southampton Row and Little Queen Street; (2) that Southampton Row (from Bloomsbury Place to Holborn) and Little Queen Street are too narrow for existing traffic, and the narrow exits of these thoroughfares into Holborn only admit of two vehicles abreast; (3) that unless these thoroughfares of Little Queen Street and Southampton Row are first widened and rendered suitable for additional traffic, the proposed removal of the gates near the Euston Road will, by increasing the traffic through these narrow thoroughfares, seriously aggravate the grave inconvenience now experienced by the public and ourselves as traders in Holborn, Southampton Row and Little Queen Street. The memorialists, therefore, urge upon the London County Council to defer opening up a new public thoroughfare from North London into Holborn by removal of street gates toward Euston Road until such time as the Council shall be in a position to effect the necessary widening of Southampton Row and Little Queen Street, and give convenient access therefrom into Holborn.

EMPLOYERS' LIABILITY ACT.

THE House of Lords on Tuesday gave judgment in the appeal case of Smith *v.* Charles Baker & Sons. A very important question affecting the responsibility of employers for injury sustained by a workman was involved. The appellant, Smith, was employed by the respondents, a firm of railway contractors, in rock-cutting in the Halifax high level cutting. During these operations a large stone fell upon him, the accident being brought about by workmen employed on other operations. On proceedings being taken in the County Court the judge entered judgment for 100*l*. This being appealed against, the late Baron Huddleston and Mr. Justice Wills dismissed the appeal, with leave to carry the case to the Court of Appeal. The Court of Appeal directed judgment for the defendants. Against this judgment Smith appealed to the House of Lords. A majority of their lordships reversed the judgment of the Court of Appeal, and restored the judgment of the County Court judge. The Lord Chancellor, in the course of his judgment, said:—I think the cases cited at your lordships' bar established conclusively the point for which they were cited—that a negligent system, or a negligent mode of using perfectly sound machinery, may make the employer liable quite apart from any of the provisions of the Employers' Liability Act. In Sword *v.* Cameron it could hardly be doubted that the quarryman who was injured by the explosion of the blast in the quarry was perfectly aware of the risk, but nevertheless he was held entitled to recover notwithstanding that knowledge. It seems to me that in the present case the right of the plaintiff to recover is far more clear than in Sword *v.* Cameron. The interval given to the quarryman to seek shelter was the usual and ordinary one. But suppose in that case the employer had employed the quarryman to do something which by the very form of the employment prevented his hearing the signal which gave him warning to retreat. In this case, as I have pointed out, there was no warning and no signal, but the employer or his representative employed the plaintiff under such circumstances as disabled him from using his eyes for protecting himself against the risk. It seems to me, therefore, that this is a case in which the plaintiff is entitled to recover, and I therefore move your lordships that the judgment of the Court of Appeal be reversed and the judgment of the County Court judge restored.

NAPLES.

THE marked improvement in this city during the last five years, through the demolition of old buildings, construction of new streets, erection of public buildings and, more important than all, the complete system of drainage almost finished, whereby nothing offensive can be discharged into the bay, has led the Neapolitan Municipality to take steps to add to the attractions of the city by the introduction of bathing établissements of a novel, varied and comprehensive character. To this end we understand that a concession has been granted to a syndicate of Italian and English gentlemen, who will have the exclusive right in perpetuity to the bathing-arrangements of the whole bay, they having agreed to purchase and compensate all the present proprietors of the erections now used for that purpose. The concessionaires have undertaken to erect in their stead three elaborate établissements, on convenient sites in the bay, that will secure not only to the residents, but also to English, American and other visitors, all kinds of baths,

hot, cold and medicated, together with open sea-bathing at safe and graduated depths. These establishments will combine a variety of recreative enjoyments with pension and restaurant accommodation. We purpose at an early date publishing sketches of one or more of these erections from plans that have been placed at our disposal by the English and Italian engineers who have been entrusted with the designs. We understand that the Royal Marina of Naples, as it is designated, will be under the patronage of and has already received valuable aid from several members of the Italian Government and other distinguished Neapolitan gentlemen.

THE STATE OF THE THAMES.

AN urgent protest has been sent to the London County Council by the Woolwich Local Board of Health on the subject of the River Thames, which, in spite of all the labour and cost bestowed upon the works of precipitation and deodorisation at the outfalls, is reported to be this summer in a worse condition than ever. The water is getting polluted over a broader area every year; it is almost as bad now at Greenwich as at Woolwich, it smells badly when stirred by the steamboats at Limehouse, and it is expected to become contaminated between London Bridge and Westminster within the next twelve months as badly as it was before the execution of the main drainage works.

NEW CATALOGUE.

WE have received from Messrs. Hayward, Tyler & Co., hydraulic engineers, a copy of their new catalogue, Part C, on pumps and pumping machinery, which will be further referred to next week.

THE hardware catalogue, "Architects' Illustrated Catalogue of Builders and Contractors' Hardware," just issued by Messrs. F. W. Reynolds & Co., of Southwark Street, S.E., is a large and nicely-bound volume containing nearly 400 pages, and compiled with care. Kitcheners, stoves, fireplaces, chimney-pieces, tilework, baths, hot-water and heating appliances, locks, brassfounding and the numberless articles that for brevity may be described as builders' ironmongery, stable appliances and fittings, sanitary goods, &c., are catalogued. But saying this does not exhaust the goods catalogued, for such diverse articles as safes, planing and moulding machinery are included, and the requirements of surveyors and also plumbers provided for; smiths' tools and apparatus, horseshoe nails and axles, springs, spokes, hubs, felloes, &c., matters which space would not allow of mentioning. Those consulting the catalogue will probably have to tax their minds considerably to think of an article or appliance that they will not find catalogued. The kitcheners, ranges and other cooking apparatus are shown in a large assortment to suit all needs and purposes. In addition to warming stoves, there are gas fire stoves and oil stoves, with gas cooking or oil cooking stoves included. The register stoves for rooms are of every description and the tiled stoves of a varied and handsome description, possessing the qualities now sought for, resulting in economy in fuel and in cleanliness. Good work is also catalogued in overmantels, of which, as well of mantelpieces, there are numerous patterns, and many tasteful ones to select from. Curbs are also an important matter nowadays; in addition to these, tilework for hearths and stove panels are illustrated. Windows' and lights' and door fittings and furniture need not be mentioned further than to refer to the specimens of cast-iron overdoors of good design: railings, gates, vanes, finials, cresting, rainwater goods, contractors' carts and vans, asphalte cauldrons, oils, colours, cement, galvanised iron material are a few of the many diverse matters dealt with in this comprehensive catalogue.

The Indestructible Water-tap.—This patent is the invention of Sir William Thomson, D.C.L., LL.D.; the Palatine Engineering Company, Limited, of Liverpool, are the sole makers. One of the main principles consists in dispensing with the washers used in ordinary cocks, which cause constant trouble and expense, metal to metal being for the first time, under Sir William Thomson's invention, rendered perfectly watertight. These taps have been under test and in use all over the country for more than a year with perfect success. They have been approved, after prolonged tests, by the official authorities of London, Manchester, Glasgow, Leeds, Liverpool, Birmingham and a number of other towns. In Manchester the approval was given only after twelve months' trial on a hot-water service in the Corporation testing-rooms. The engineer of the Portsmouth Waterworks Company, in a letter to the Palatine Company, says:—"I have pleasure in informing you that I have been having your tap tested under pressure and automatically opened and shut, such being recorded upon a recorder attached to the testing-machine, the result being that it was opened and closed 604,000 times, equal to about fifty-four

Ewarts 346 Euston R. N.W.
Hot Bath in 5 Minutes Lightning Geyser

years of ordinary wear, when it began to show signs of leaking. At this point the spring was taken out and tested for elasticity, and no perceptible difference could be observed then from that at starting, after which the testing was continued to ascertain its lasting qualities, when it finally gave out after it had been opened and closed 911,000 times, equal to about eighty-three years of ordinary wear." The directors have agreed to use these fittings through their district.

IN the notice last week of the new catalogue of the Midland Wire Cordage Company the word "lighting" has, by a printer's error, been substituted for "lightning."

VALUE OF LAND IN PALL-MALL.

A SITE belonging to the Crown, situate opposite the Athenæum, Reform and Travellers' Clubs, having a frontage to Pall-Mall of 59 feet, by a depth of 60 feet 3 inches, and comprising, including the area in front, 3,770 square feet, has, at the Mart, been offered for letting by auction on a building lease for eighty years, by Messrs. Driver & Co., of Whitehall, and after considerable competition was let at the yearly rent of 1,525*l.*, which is at the rate of 8*s.* 6*d.* per square foot of building area. This, if brought into fee-simple value, at twenty-five years' purchase, would represent nearly 500,000*l.* an acre.

AUGUST BANK HOLIDAY ON THE CONTINENT.

FOR the August Bank Holiday cheap tours have been arranged to the Belgian and Luxemburg Ardennes by the Great Eastern Railway, viâ the Harwich route, enabling holiday-makers to visit Belgium and the Grand Duchy of Luxemburg, including Antwerp, Brussels, Liège, Spa, Dinant, and the hitherto little visited picturesque valleys and interesting old towns of the Grand Duchy. Passengers leaving on Friday or Saturday reach the Ardennes the next afternoon, and can return on Monday in time to reach their homes early on Tuesday. For a longer visit, Holland, the Moselle and Rhine can be included in the above tours. The Great Eastern Railway Company has arranged, in conjunction with the General Steam Navigation Company, trips to Hamburg. Passengers will leave Liverpool Street Station at 8.0 P.M. on Tuesday, July 28, Friday the 31st, or Saturday, August 1, and return by any General Steam Navigation Company's steamer within two months of the date of issue. A steamer of the Wilson Line will also leave Harwich on Friday, July 31, for Norway, Christiansand and Christiania.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

11429. Gillery Smith, for "Improvements in the method of attaching knobs or handles to locks and latches, and various articles of furniture and the like."

11430. Alfred Lanning, for "A double grip spring safety hook."

11441. John Anderson, for "The ventilating of greenhouses, vineries or public buildings automatically."

11496. George Wheelhouse Robinson, for "An improved construction of floor covering."

11524. Charles Aubrey Day, for "Improvements in fireproof buildings and appliances therefor."

11577. Frederick Pugh, for "Oil-cloth as an improved substitute for wall-paper and for ceiling panel, railway carriage and other decorative purposes."

11635. John Stephens, for "Improvements in door bolts, sash fasteners and the like."

11642. Henry Heartfield, for "An improved water and fireproof fibrous material suitable for the manufacture of plain or decorated wall, ceiling or floor linings, electrical and other conduits, bases and coverings, and numerous other purposes for which wood, paper, plaster and cement are now used."

11721. George Hatton, for "Improvements in knobs or handles for door latches."

11812. Richard Hill Dawe, for "Improvements in apparatus and appliances to facilitate the opening, closing, fastening and securing of doors and gates."

KALLKOLITH.
NEW PATENT PRIMING AND STAIN.
Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of KALLKOLITH goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where KALLKOLITH is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with KALLKOLITH, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special Terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

A Business Supplement

The Contract Reporter.

to The Architect.

LONDON, JULY 31, 1891.

NOTICE.

THE SURVEYORS' INSTITUTION, Incorporated by Royal Charter, 12 Great George Street, Westminster.

Under the Provisions of the Charter of the Surveyors' Institution, the present "Practice" qualification for admission to membership will cease after August 26, 1891.

Applications for admission to the Fellowship without Examination must be made before the above date on forms to be obtained of the Secretary. The following are eligible, subject to the rules laid down in the By-laws, viz.:—

Surveyors, whether connected with Architecture, Engineering, Land, Building or Mining. Land or Estate Agents, resident or otherwise.

After August 26, 1891, the admission to the several classes of Professional Membership will be by Examination.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

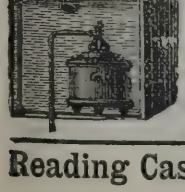
BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.



We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

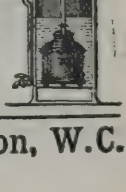
A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE
LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.



Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards Portable Filters on this System, £1 5s. to £3.

REGISTRATION OF PLUMBERS.

THE Devon and Cornwall District Council for the national registration of plumbers met last week at the Drake Chamber, Plymouth. Dr. F. M. Williams, the medical officer of health, in acknowledging his election as a member of the District Council, remarked that the Council were doing a great deal to assist the sanitary authorities. Bad and unscientific plumbing had been the cause of many valuable lives being lost, and the national registration of plumbers was a great safeguard to the public health. On the motion of Mr. Hamblyn, seconded by Mr. White, Messrs. Rowe, Pearce, Serridge, Shuter and Andrews were appointed to wait upon the Plymouth Water Committee to ask, in the name of the Council, that only duly qualified plumbers should be employed as examiners under the new regulations of the committee.

VARIETIES.

A DONATION has been received by the treasurers of the Dundee Royal Infirmary of 210*l.* from the Dundee Working Men's Coffee-houses and Reading-rooms Association, in order to name a cot in the children's ward.

IT is proposed to widen and improve the county bridge over the river connecting Shipley and Baildon. The cost is estimated at 3,000*l.*

AT the meeting of the Montrose Town Council an offer was read from Messrs. D. Tosh & Son, Glasgow, to repair the steeple for the sum of 250*l.* It was agreed, before accepting any offers, to instruct the burgh surveyor to prepare specifications of the work, and to advertise for offers.

THE Ossett Town Council have adopted plans prepared by Mr. John Hanson for the extension of the Eastern Outfall Sewage Works, and will apply to the Local Government Board for sanction to a loan of 700*l.* for the purpose.

AT a ratepayers' meeting held at Uttoxeter Mr. W. H. Radford, C.E., of Nottingham, explained a scheme for new waterworks in the town. The present waterworks are almost useless through lack of pressure and faulty design, and it is proposed to construct a new service reservoir with water-mains throughout the town, and to take powers to acquire additional springs at Somershall Herbert, 3½ miles from the town. The cost of the engineering works would be 5,450*l.* An Act of Parliament will be required. A resolution approving Mr. Radford's scheme was passed unanimously.

AT the meeting of the Surrey County Council it was reported that the arrangements for the site of the new county buildings at Kingston were practically completed, and that it was intended to carry out the buildings in accordance with the plans and specifications prepared by the county surveyor, as approved by the Council.

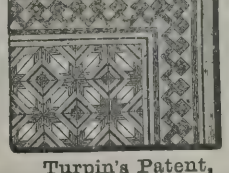
THE first section of the Douglas Head Marine Drive, Isle of Man, said to be the finest work of the kind in the kingdom, has been opened. The estimated cost of the drive is 40,000*l.*

ANOTHER attempt is to be made by the Skipton Local Board to carry out the Skibeden water scheme, and to promote a Bill in the next session of Parliament to obtain the necessary powers. The Board will ask for power to borrow 40,000*l.*, which will be the complete cost of the works.

AT the last meeting of the Hastings Board of Guardians it was proposed that none of the tenders sent in for the erection of the new workhouse be accepted, and that the architect be requested to furnish his account. The latter part was ruled out of order, as it would rescind a previous resolution. After a long discussion the first part of the resolution was carried by eighteen votes to two.

THE *Leeds Mercury* says:—At a meeting of the Sewerage Committee of the York City Council, held on Tuesday, particulars were received of the claim of Mr. Bottoms, the contractor, in connection with the stoppage of the sewerage works. We understand that the claim, which is stated to be about 10,000*l.*, is based on the ground that the terms of the contract entered into were impossible of fulfilment. The committee instructed the town clerk to file a defence to the action.

PLANS have been prepared for a church proposed to be built for Staincross and Mapplewell, near Barnsley. The building will cost between 2,000*l.* and 3,000*l.*



OWING to the alleged defective way in which private drains were often constructed, the Wrexham Town Council has resolved that the by-law relating to these drains shall be strictly carried out, and that the borough surveyor should be instructed to inspect all new house drains previous to their being covered up.

AN old clay quarry hole at Millerhill, Edinburgh, has been used as a receptacle for the refuse of the city. The occupant of a mansion-house, about 450 yards to the west of the quarry, having complained of the smells and swarms of flies which come from the refuse, the County Council ordered an examina-

tion of the place by their health officer, with the result that an intimation has been sent to the town clerk that the disposal of the city refuse in the quarry hole must be stopped under threat of interdict. Threatened with interdict within and without the city, the Cleaning and Lighting Committee are said to be nearly at their wits' end to know what to do with the refuse.

TERMS proposed by the Dudley Corporation have been accepted by the proprietors of the Dudley Arms Hotel, for the purchase of the property at the head of Stone Street for a public improvement.

THE Tipton Board of Health have appointed a sub-committee to consider the question of water supply and the charges of the South Staffordshire Waterworks Company.

THE Southampton Town Council have authorised the purchase of a camera by the Medical Officer of Health. The necessity was mentioned at the meeting of the Medical Officer having a camera for the purpose of taking photographs when applying for an order to close dilapidated property.

WORK is shortly to be commenced on the forming of a new lock on the Thames, between Richmond and Twickenham, by the Thames Conservators. The cost of the improvement is estimated at 60,000*l.*

THE prospects of a settlement of the dispute between Messrs. Lucas & Aird, contractors of the West Highland Railway, and the promoters of the line are, it is stated, considered remote. The contractors have issued instructions for their working plant to be collected and stored in the sheds at the various depôts. Between forty and fifty miles of the permanent way have been completed.

TRADE NOTES.

THE growth of the great metropolis is continually being brought to mind by the extension of the powers and appliances of the police force and the fire brigade. It was not long since that three large floating steam fire-engines, of a combined capacity of 250,000 gallons per hour, were built by Messrs. Merryweather for the fire brigade, and last week the County Council ordered a new land steamer from the same firm, of their "Metropolitan" type, similar to fifteen engines previously supplied, in addition to a number of other sizes.

WE have pleasure in announcing that Messrs. Frank Suter & Co., electric light engineers, of 276 Strand, have removed to larger and more convenient offices and showrooms at 66 Berners Street, Oxford Street, W., where they intend to exhibit an extensive stock of electric light fittings.

WE are informed that Messrs. C. Carr & Co. have secured the order to supply a peal of six bells, about 50 cwt., for the coming pantomime of "Dick Whittington" at the Prince of Wales's Theatre, Birmingham.

THE Directors of the Aberdeen Royal Infirmary have at recent meetings had under consideration the question of engineering plant and electric light installation for the new buildings. Specifications were prepared by Professor Jamieson, Glasgow, and estimates obtained. The directors have accepted the offer of the Babcock & Wilcox Company, Limited, Glasgow, for the engineering plant, including two 100 h.p. boilers; and the electric lighting has been entrusted to Messrs. J. H. Holmes & Co., Newcastle-on-Tyne.

IN the rebuilding at present being carried out on the Duke of Norfolk's estate, Strand, one of the important features is the clock-house, which is just reaching completion, the general contractor for the work being Mr. John T. Chappell. Careful attention has been given to the ventilation, which has been carried out by The "Climax" Ventilation Company, of 15 Great George Street, Westminster.

THE Victoria Hospital for Children, Hull, opened last week by the Marchioness of Salisbury, is warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves, with descending smoke flues, and with ornamental tiled sides. These stoves were supplied by Mr. E. H. Shorland, of Manchester.

IN the notice of the visit of the Civil and Mechanical Engineers' Society to the works of Messrs. Burt, Bolton & Hayward, given in the issue of July 10, Mr. Ashley was incorrectly described as "works foreman," instead of manager of the timber department.

THE tender of Messrs. Perrin & Long, of Winchelsea, to construct a new supplemental reservoir for the sum of 4,759*l.* has been accepted by the Bideford Local Board.

THE directors of Perry & Co., Limited, have resolved to pay out of profits an interim dividend on the ordinary shares, for the first six months of this year, at the rate of 10 per cent. per annum, free of income tax, being at the same rate as for the corresponding period last year.

THE roof ventilators at the Birmingham Law Courts were supplied by Mr. John Gibbs, of Liverpool; the lifts throughout

by Messrs. Tangye Bros. Many of the ceilings of rooms in the building are of moulded fibrous plaster, made by Messrs. George Jackson & Sons. The details of the ceiling of the judges' corridor were modelled by Mr. W. S. Frith. The entrance-gate to the principal porch is of wrought-iron from the architects' designs, and bears in its centre the city arms executed in the proper colours in cloisonné enamel work on bronze, with bronze "supporters," executed by Mr. Clement Heaton. Much of the flooring is executed on Dennett's system. The clock is by Messrs. Gillett & Johnston, of Croydon, the external skeleton dial having been executed in wrought-iron by Messrs. Starkie Gardner & Co. The system for heating and ventilation was described in *The Architect* of July 10.

BUILDING AND BUILDERS.

LEAVE has been granted by the Partick Dean of Guild Court to the Hydraulic Foundry Co., Limited, to make alterations and extensions at their lately-acquired premises in Whiteinch.

AT a meeting of the Gas Committee of the Aberdeen Town Council a sub-committee was appointed to report on the question of increasing the office accommodation at the Gas-works.

THE Governors of the Radcliffe Infirmary, Oxford, have decided to erect a new male ward and to rearrange the old block for administrative purposes, at a cost of about 10,000*l.*

THE *Devon and Exeter Gazette* announces the death, at Bournemouth, of Mr. W. Ryan Commings, formerly of Heavitree House, Exeter, at the age of 55 years. Mr. Commings for a considerable number of years was the principal of the building business which is now being carried on by Messrs. Tree & Bolley.

IN submitting the report of the Markets and Fairs Committee, at the meeting of the Birmingham City Council this week, it was stated that the committee were proceeding with the plans for the new pig market in Montague Street, and that before the committee separated for the holidays they would be able to accept tenders for the necessary work.

THE Bath branch of the Bristol and West of England Bank, Limited, removed its business on Saturday from the temporary premises in Northumberland Buildings to the handsome premises provided for it at No. 42 Milsom Street. The architect for the work was Mr. Alfred S. Goodridge, M.R.I.B.A., of Bath. The contractors were Messrs. Hayward & Wooster. The carving was executed by Mr. Sheppard, of Bournemouth; the bronzes, wrought ironwork, gasfittings, &c., by Messrs. Singer & Sons, of Frome; the decorations by Mr. Beaven, jun., of Bradford-on-Avon.

THE new church, Southwick, Kirkcudbrightshire, has just been opened. The church will accommodate comfortably over 200 persons. A chime of bells, the gift of Miss Stewart, Southwick, has been hung in the tower. The building costs over 2,000*l.* The architects were Messrs. Kinnear & Peddie, Edinburgh.

AN EAST-END MISSION HOUSE.

THE corner-stone of St. Frideswide's Mission House in Lodore Street has been laid by Miss Phillimore, a sister of Sir Walter Phillimore, Q.C., who is giving the site and providing the means of building the house itself. The building is to be erected for the accommodation of sisters trained in the House of Mercy, Clewer, near Windsor. The foundation-stone at the north-west angle of the building is of red Corsehill, and bears the inscription, "St. Frideswide's Mission House" on the Lodore Street face, having a raised cross in the centre; the inscription next Duff's Fields being "Laid July 9, 1891." The building will be a complete example of this purely modern type of building, everything being arranged with a view of separating the different sections of the building at ordinary times, while communication with all parts is secured when required. It will contain on the lower storey a spacious clubroom and recreation-room for girls, a soup kitchen and a parish-room. The community's refectory, kitchen, scullery and offices will also be placed on the same floor. By passing through the open yard, the church of St. Frideswide adjoining will be reached by the community without it being necessary to go into the street. On the next storey there will be a sitting-room and two bedrooms for lady workers in the parish, a private room for the sister in charge, the sitting-room for the community and a small oratory adjoining the church. There will also be a guild-room for girls, reached by a separate staircase placed next to the room for the sister in charge. Two pair storey: nine bedrooms, work-room, bath-room, &c. The exterior of the building will be intentionally simple. The object in view has been to secure a good outline and an easy homelike appearance. The only feature of importance will be the main entrance for the community in Lodore Street. The

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

D

elevation will be of blue Staffordshire bricks, to a height of 4 feet above the pavement, and above that height of yellow, with an admixture of red bricks. Messrs. Clarkson, of 146 High Street, Poplar, and 28 Great Ormond Street, W.C., are the architects.

THE CARLISLE MASONS' AGITATION.

FOR some time past, says the *Carlisle Journal*, an agitation has been going on among the operative masons of Carlisle, in common with those of many other centres, for an advance in wages and a reduction of the hours of labour. About twelve months since the wages paid by the masters in this city amounted to 6*d.* per hour, but in the interval up to the present time the men have asked for several increases in wages, which at the commencement of this week stood at 8*d.* per hour. These advances the masters have willingly conceded, the state of the building trade being brisk and general conditions making the request on the part of the operatives reasonable and fair. Recently, however, the men agreed to ask for another ½*d.* per hour, so as to make their rate of pay 8½*d.* instead of 8*d.*, and a meeting of the masters was held at the Coffee House Hotel to consider the application. The result of the conference which took place was that the masters, with the view of protecting their own interests and the interests of their clients, formed themselves into a Master Builders' Association, and the question at issue was adjourned for a week. Another meeting was held last week, when a lengthy list of demands was brought forward on behalf of the operatives who had formed themselves into a society. The masters agreed to advance the men's wages as requested from 8*d.* to 8½*d.* per hour, but did so without prejudice to the final adjustment of the various matters which will now have to be debated by the rival associations. The concession was granted with the view of preventing the possibility of a strike and also to secure the non-disturbance of several contracts now on hand. The masters, however, hold to the opinion that the state of the building trade is not such as warrants the permanent advance in wages that they have conceded.

The following are the ten various requirements which the operative masons have drawn up, and which are to be considered :—

Hours of Labour.—From February 14 to November 11, work to commence at 6.30 A.M. and cease at 5 P.M., Saturdays excepted, when work shall cease at noon all the year round. From November 12 to December 12, work to commence at 7 A.M. and cease at 5 P.M.; from December 13 to January 13 work to commence at 7.30 A.M. and cease at 4.30 P.M.; and from January 14 to February 13, 7 A.M. to 5 P.M., or start at any half-hour up till 9.30 A.M.

Meal hours.—Half an hour for breakfast and one hour for dinner.

Wages.—8½*d.* per hour all the year round.

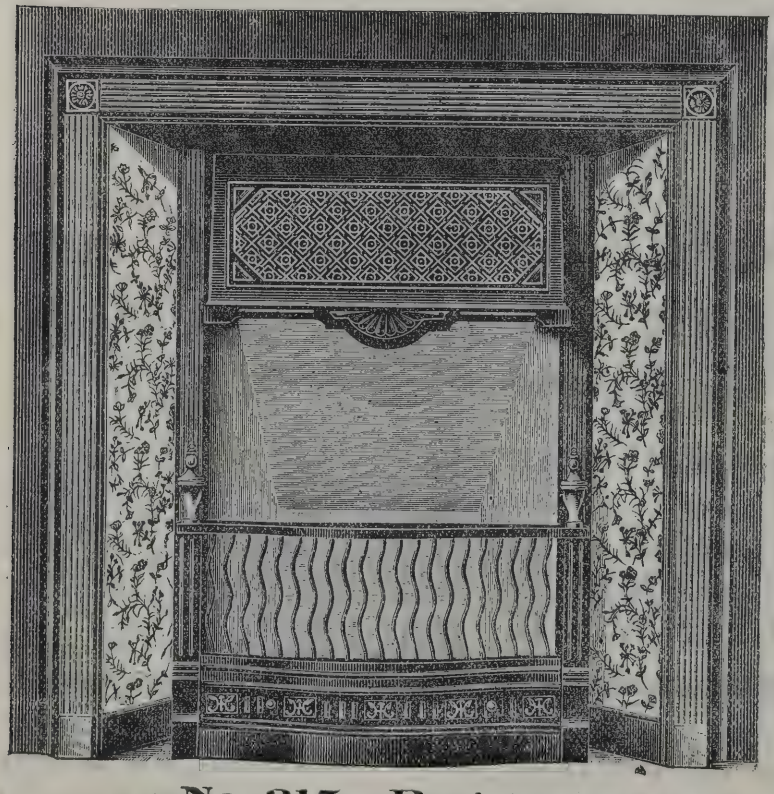
Walking time.—Walking time to be allowed to all country jobs three-quarters of a mile from the Town Hall, at the rate of three miles per hour. All jobs three-quarters of a mile from the Town Hall to be paid on the job, or men to be allowed walking time to the office.

Sheds.—Sheds, &c., to be erected on all jobs where necessary.

Overtime.—Overtime to be worked only in cases of emergency. Overtime on Sundays and Christmas Day to be paid double wages, and overtime during the week to be paid at the rate of time and a quarter for the first two hours, time and a half for the next two hours, and double time after that.

Piecework.—All work to be done by the hour, and no employer to sublet any portion of his contract. No mason to do piecework. No worked stone to be allowed to come into the town except Bath and Caen stone, Lazonby and Yorkshire steps and landings.

Notice.—One hour's notice to leave on either side.



Apprentices.—Apprentices to be legally bound for not less than five years, and not to work more than three months or be over 16 before legally bound. Masons' sons and stepsons to be exempted from this rule. Not more than one apprentice to six men.

Alterations.—Alterations in the foregoing stipulations to be given three months' notice of on either side between May 1 and August 1.

FRYER'S VENTILATORS AND COWLS.

THE special advantages claimed for the patent ventilators of Messrs. J. D. & W. Fryer, North Works, Brecon, are:—1. Simplicity in construction; no loose part to get out of order; no winding screw to get clogged or choked with dust, &c. 2. The working arrangement of these ventilators is so sensitive that the least breeze will cause the head to revolve rapidly,

CROSTHWAITE'S PATENT STOVES, WITH ADJUSTABLE CANOPIES.

A NEW ILLUSTRATED PRICE LIST, containing 80 pages of Stoves, Interiors, &c., is now ready. Those desirous of having a copy will please forward their name and address to the Patentee,

Robert Crosthwaite,
Ironfounder,
153 Queen Victoria Street,
LONDON, E.C.

PATENT No. 2496. A.D. 1884.

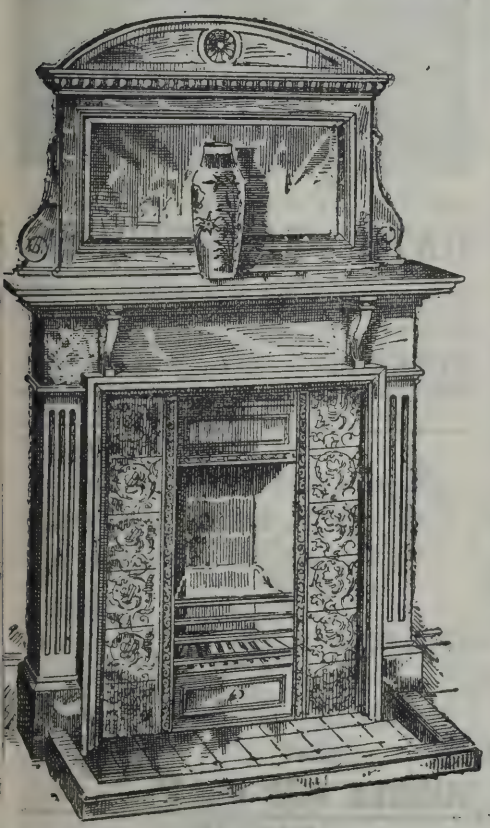
thereby creating a change of atmosphere in the room in all weathers. 3. Absence of friction; bearings, which are ball, move in oil. 4. Fully 100 per cent. greater up-draught caused by the inlets in each side. 5. Patented hinge flap in top of head renders easy access to the bearings for oiling, &c. 6. A snowstorm does not impede their action, neither are they affected by frost. 7. Inside of base a conical syphon is fitted, by which the force of abstraction is doubled. 8. In the inside

of the revolving hood angular vanes are arranged, which greatly increase its discharging power.

The ventilators are for ventilating all kinds of buildings without opening windows or doors, and they are made of galvanised steel sheets and covered with enamel paint. The ventilators are specially adapted for churches, chapels, schools, theatres, concert-halls, hotels, clubs, smoke-rooms, mansions, lecture-halls, billiard-rooms, studies, public buildings of any kind, factories, warehouses, workshops, storerooms, stockrooms, granaries, maltrooms, washhouses, laundries, stables, coach-houses, cowhouses, outhouses, summer-houses, &c.

NEW CATALOGUES.

AN illustrated list, "C" 1891, has been issued by Messrs. Hayward Tyler & Co., hydraulic and general engineers, brass-founders, &c., of Upper Whitecross Street, E.C., of pumps and pumping machinery, well-frames, steam-fittings, engineers' sundries, &c. Notes as also tables are furnished, and these, the tables especially, are most useful addenda to a catalogue of this description. The word "pump" naturally conveys the idea of lifting water. Water is incapable of motion, beyond flowing or falling to a lower level, unless force, natural or mechanical, is applied. Water, wind, fire, steam can all be pressed into service as motive powers, or the motive power may be a man, a horse or other animals. Water has to be lifted for many purposes, among others for protecting life and property, as in the case of ships' pumps and the fire-engines of our fire brigades. There are pumps for wells, force-pumps, pumps and pumping machinery for collieries and the deep Cornish mines, pumps for agricultural purposes, for gardens, for contractors, pumps worked on the windmill principle, and the hydraulic ram, a development of modern days, working, as it is called, automatically. Every principle which has ever been used for lifting water is still in use to-day in some improved form, besides what new apparatus has been devised by modern science, for example, the primitive idea of shovelling-up water or lifting it by buckets is now scientifically applied. We do not intend to go into details of the numberless pumps, &c., spread over nearly two hundred pages in this catalogue. A reader of the catalogue would find in one kind of pumps, those worked by hand, for instance, quite enough to occupy his spare time in the mere reading. Luckily, in consulting the catalogue a person knows his requirements. According to these requirements it is not difficult to determine what agent to apply as motive-power. The tables, calculated from past experience, are a trustworthy guide in another direction; local circumstances he also takes into consideration, and out of what may appear a perplexing choice in the variety of the one particular kind suitable, he selects that which is the most efficient and the most economical in the expenditure of fuel, or, it may be, labour, time, &c.



MESSRS. WYCKOFF, SEAMANS & BENEDICT, of 100 Gracechurch Street, E.C., sole proprietors and manufacturers of the "Remington Standard" typewriter, have sent us their illustrated price list. It may be mentioned that No. 4 Remington Standard typewriter is stated to have been used with wonderful success by blind persons. No. 5 is a new model, specially

designed for use in this country, taking paper nearly 9½ inches wide, and writing a line nearly 7½ inches long. Various cabinets with drawers, tables used in connection with the typewriter, are illustrated; also travelling-cases, copyholders, &c.

Many pages are also added explanatory of the process of typewriting, together with details and information the omission of which would be a distinct loss to any person possessing a typewriter for the first time.

Heating and Ventilation.—An illustrated price-list has been brought out by Messrs. Kite & Co., ventilating, sanitary and heating engineers, of the Christopher Works, Chalton Street, N.W. Mr. Kite's name has been so long associated with questions of ventilation, from the attention he has paid to them, and having been among the first to study the subject, that it is not surprising to find that he has been at the pains to combine under the same cover a useful treatise on ventilation, thus giving the results of his experience in a simple way, in which anything like mystery is avoided. Messrs. Kite & Co. have received numberless medals and honorary awards at exhibitions, and can show a large collection of testimonials also received by them.

THE NEW POST OFFICE FOR LEEDS.

A CORRESPONDENT who has been comparing the new design for the post office about to be erected on the site of the old Coloured Cloth Hall with that originally prepared, to which exception was taken by the Corporation and other public bodies, has sent us, says the *Leeds Mercury*, the following notes:—The front elevation in both designs is broken up by dividing it practically into three parts. The centre portion consists of five bays, and is flanked on each side by two projecting pavilions, which are also broken up by two projecting wings and a recessed centre, containing projecting bay windows. The principal points of difference are the substitution of Tuscan columns in addition to the recessed panelled pilasters forming the piers between the windows of the central arcade of five bays constituting the central recess. The doorways are certainly more imposing by the pediment being raised so as to include the windows over the doors and the outer columns to carry figures. The bay windows, two storeys high, forming the centre feature of the pavilions, are made wider, and will be improved by retaining the carving over the ground-floor windows and the perforated parapet, as shown in the original design. Over the piers of the central arcade are substituted circular Corinthian columns, supporting a plain frieze and moulded cornice and a sculptured statue, instead of the plain flat pilasters dividing the windows in the original design. The third or top storey is practically about the same as in the first design, but there has been a decided attempt to improve the outline of the building above the parapet main cornice. The first design showed a bold and striking centre gable, spanning the three central bays of the centre recess, and over this, rising from the ridge, is an octagonal turret, with pilasters and domical roof, with a lantern light above, terminating with a small dome and finial. In lieu of this centre gable are substituted a series of five dormer windows rising above the parapets, with pilasters and pediments, and in lieu of the centre turret there rises from the centre of the roof a square tower formed by four pilasters, with three recessed arched openings on each side, and with a parapet and angle terminals; and above is an octagonal lantern light, with plain pilasters placed across the angles and surmounted by a dome and finial. The outline of this tower is very suggestive of the outline of the town hall on a diminutive scale, and it is questioned whether this feature and the fine central dormers would not be much better omitted and the original central gable and octagon turret retained. Instead of the four plain, slated roofs at the angles of the pavilions, octagonal pedestals and terminals are placed on each side the attic windows, which have pilasters and pediments, surmounted by substantial blocks of masonry formed of coupled flat pilasters on each side an open circular arch, with entablature of frieze, and cornice and blocking above. There is no alteration in the side elevation to Infirmary Street, which, with the exception of the north-eastern gable, is two storeys high, with circular arcaded windows, broken up by projecting wings,

terminated by gables surmounted by curved pediments. The roof-line between these side gables is broken up by dormer windows crowned by cornices and pediments. The alterations suggested by the new design are more expensive, and will decidedly present an improved architectural appearance and be more in accordance with the growing importance of the town. The building when complete will be one of which the inhabitants may be justly proud.

The council of the Leeds and Yorkshire Architectural Society have made the following report on the new design :—Generally speaking, we consider the amended design a decided improvement upon the one originally submitted. There is a boldness and breadth of treatment displayed in the handling of the architectural features which was lacking in the first design. This improvement, however, does not apply to the design of the central tower, or cupola, which, although of larger size than that originally shown, is feeble in design, and certainly requires further consideration. If it is to be carried out in stone as stated in the newspapers, its architectural features are on too small a scale to harmonise with the proportions of the building below ; and if it is to be of woodwork, it would prove much too large for suitable treatment in that material. The improvement of the central portion of the principal façade may be characterised as follows :—The range of semicircular, arched windows on the ground floor gains by being deeply recessed, and treated with detached columns in place of panelled pilasters; and on the first and second floors above, the wall surface and fenestration, with detached columns carrying statuary between each window, are marked improvements upon the original design, which was much too "crowded" in effect. Exception may be taken to the range of five dormers above the parapet, over the main cornice, which have a meagre look about them, and would be improved if handled in a bolder and less stiff manner. By the lifting up of the pediments over the fanlights of the principal entrance doorways, in place of being situated below as at first intended, these important architectural features are additionally emphasised, and in consequence have a better appearance. The slightly projecting end wings of the front elevation we think are improved by the groups of chimney shafts linked together with arcading, in place of the receding hipped roofs which characterised the original design. Below the cornice, an appearance of solidity is imparted to these portions of the structure by means of piers at the angles of the projections. It is cause for regret that the architect has not arranged for a more suitable position for the letter-boxes than the one indicated under the window-sill of the bay-window of the sorting-office, with its overhanging metal or glass shelter. A recessed loggia or arcade would appear to us more worthy of the building.

ATHENÆUM BUILDINGS, GLASGOW.

IT is little more than three years, says the *Glasgow Herald*, since the Athenæum removed from the building it so long occupied in Ingram Street to the handsome new building which had been erected for it in St. George's Place, and so marked has been the success attending the various departments of the institution in its new home that the directors have been obliged to make arrangements for the further extension of the building. Plans have been prepared with this object, and passed at the Dean of Guild Court. The new building, which will occupy the site of the old Religious Institution Rooms, will have a frontage of about 45 feet to Buchanan Street, and extend along St. George's Court about 86 feet, and will give accommodation to the following departments of the institution :—1. For the School of Music, the Dramatic Society, and general purposes, a hall seated for 700 persons. 2. For the restaurant, a large light luncheon-room, a large smoking-room, and a dining-hall, about 85 by 40 feet, with a complete kitchen and administrative department. 3. For the recreative department, a public and a private billiard-room, the one with five tables and the other with one. 4. For the School of Music, music-rooms and a large room for drawing-room entertainments. 5. A new gymnasium, with extensive dressing-rooms and lavatories.

The entrance is at the north corner of the site, and a handsome staircase, oval in plan, with an elevator in the centre, gives access to the various floors, with a service elevator at the angle of the stair, taking the place of a service stair. The hall, which is situated in the basement, is seated as a theatre, with folding-chairs, the audience being about equally divided in area and gallery, each part of the house having separate access and independent emergency doors ; these latter, opening on the lane which passes along the south side of the building, are so placed that in the event of panic the audience should be attracted to different parts of the hall in the proportion of about 100 to each door, the doors being of a size that, under the Dean of Guild Court regulations, is sufficient for the exit of 1,000 people. Cloak-room and lavatories are conveniently situated in the level of the area of the hall, and the smoking-room and light luncheon-room of the refreshment department are so situated that they

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important Inventions of the Nineteenth Century.

REGISTERED

PATENTED IN England, Belgium, France, Germany, Italy.

TRADE MARK.

PATENTED IN Austria-Hungary, Denmark, United States of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never ye been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C. : February 28, 1886.

I have had some trials made with the KALLKOLITH during the past few weeks, the results of which are very satisfactory. The KALLKOLITH is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale. J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.

We are pleased to tell you that the KALLKOLITH supplied to us has been fairly tried, and we find that it answers all that you claim for it.

CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

may be used in connection with entertainments in the hall. The dining-hall on the first floor, a handsome room with wood-panelled walls, is reached both from the Buchanan Street entrance and from St. George's Place by a gallery through the present news-rooms; with the exception of the service-room and main staircase, it covers the entire site and gives a dining area more than double that of the present restaurant; it is served by dinner and service (passenger) hoists from the kitchen in the top floor of the building. This administrative department consists of a very large kitchen, large pantries and sculleries, larders, storerooms, chef's private room, bakery, &c., fitted with every modern convenience for the rapid and economic service of a large restaurant. It contains, also, a servants' hall, with servants' dining-room and lavatory, all served by the service (passenger) elevator. The billiard-rooms are similar to those of the present building in St. George's Place, and give accommodation for six tables. The music-rooms are mostly small to suit private teaching, and, while they are constructed so far as possible to prevent the occupants of the one interfering with those of the other, more importance has been attached to grouping all the music class-rooms together in the new building, so that all other classes may be confined to the present building, where they will not be disturbed by the music. The gymnasium, with its dependencies, like the restaurant, covers the entire site, and has an open floor space of 85 feet by 30 feet 6 inches, of which 60 feet by 30 feet 6 inches is 25 feet high and lighted from the roof, and the remainder, having an outlet to Buchanan Street, is fitted with every modern apparatus for the development of the body. The club-master's private room is close to the main entrance door. The dressing-rooms are ample, and have bath and lavatory accommodation. A gallery for spectators is carried along one side of the higher part of the gymnasium. The whole building is to be ventilated by forced draught, and is to be lighted by the electric light, from the installation in the basement of the present building in St. George's Place. So much accommodation has only been obtained by raising the building to a considerable height above the street, and the building in Buchanan Street will rank among the highest of our public buildings. The floors in the main building vacated by the dining-rooms and the billiard-rooms will be remodelled as classrooms for the Commercial College, and the news-room, library and secretary's offices will remain undisturbed in the St. George's Place building. The elevation to Buchanan Street is in sympathy with the design of the original building and in keeping with the character of the institution—at once a social club and an educational establishment. The cost of the extension, it is estimated, will amount to about 15,000*l*. The architects are Messrs. J. Burnet, Son & Campbell, the measurers Messrs. J. Dansken & Purdie, and the clerk of the works Mr. Thomas Douglas.

MESSRS. YOUNG & MARTEN'S NEW PREMISES.

WE have recently visited the premises occupied by Messrs. Young & Marten, at Stratford, and should have been pleased to have also passed to their branches at Walthamstow and Leytonstone, but so extensive are the Stratford establishments, and so interesting their contents and the processes therein carried out, that the day passed away before we realised the time we had spent. We were struck by the compact little firing kilns which they have erected for firing the stained-glass. It is appropriate here to make a few remarks about stained-glass windows and stained-glass for other purposes. For many commercial purposes and also for private houses stained-glass is in demand; for the latter purpose chaste designs on whole sheets are required, and many beautiful samples are shown in the stained-glass department. For what we may call fancy stained-glass work, made of many pieces to suit any required design, this firm has special facilities, inasmuch as the work is designed in their offices, and the glass after staining, fired on the premises and subsequently there annealed in a suitable oven.

We must not, however, be carried away by the high art department, but unwillingly relinquish it for those which are all useful and some ornamental. In the Broadway, Stratford, the ground floor, which is almost wearisome in its great extent, is devoted chiefly to ironmongery and castings; but to leave it with this remark would not be doing it justice. We would not hurry through it, but chose to notice the quality of goods in stock. The castings, which include grates, gratings, rails, gates, rain-water pipes, heads and the concomitant fittings are undoubtedly of excellent quality. After passing through long corridors lined with these articles, corrugated and other iron sheets, we had a moment's rest in the engine-room, wherein is fixed the dynamo by which the current is supplied to light the whole of the premises in the Broadway. On the ground-floor there are also storerooms for paper-hangings and wall decorations on a very extensive scale. On the first floor are excellent show-rooms, devoted in part to gas-fittings of all descriptions and globes. On this floor we also find a selection

of ranges and fireplaces with overmantels. These are worthy of very careful examination. Made of iron they present all the appearance of marble or granite, and show to the experienced eye the perfection to which this class of ironwork has been brought—to the inexperienced eye they would pass for the material they represent; when fixed few could discriminate between this work and marble from its appearance. On the second floor one part is used as a show-room for ranges and fireplaces, but the back part is given up for the necessary offices, comprising the counting-house, the estimating department and the drawing office; this is well chosen, for those who have to deal with designs and estimates know how necessary it is for the proper execution of their work that they should as far as possible be isolated from the interruptions of current business.

Leaving the Broadway establishment, we will now refer generally to some of the other departments we visited; that connected with stained-glass we have already mentioned, and so we will turn to the plumbers' brasswork and the sanitary appliances. There is an exceedingly good assortment of baths for fixing in bathrooms, and this has now become a very important trade, for even low-rented houses must now be fitted with such baths or they will not find tenants, and Messrs. Young & Marten show baths to suit all sizes of houses. The introduction of the small bathroom during the past twenty years has certainly exercised a civilising and healthful influence upon those classes who previously were debarred from the enjoyment of a comfortable warm bath on their own premises for lack of the necessary privacy, which in former times could only be insured by an expensive and spacious lavatory. In the metal stores we wended our way amongst piles of lead-piping, other allied material, and bar, sheet and galvanised iron.

In the space at our disposal it would be impossible to do justice in the way of description to the immense amount of material stored in the warehouses through which we passed, so extensive that tramways are laid in some parts whereon run trolleys to convey materials from one part to another; but we must not overlook the wharf at Stratford Market, called the Caledonian Wharf and situate on the Channelsea River. We may mention that this is a tidal river, though often mistaken for a canal by those unacquainted with the topography of this interesting district. Connected with the wharf is Messrs. Young & Marten's extensive trade in timber, slates, lime, cement, bricks and other rough materials used in every branch of the building trade.

Having touched lightly upon the various departments which were the object of our visit, we may point out the advantage to builders of having within a comparatively small radius so many depôts under the control of one firm. Most of the litigation that now arises is due to the subdivision of contracts, which in many cases means a subdivision of responsibilities. If the principal contractor has to obtain his materials from a number of firms independent of, or perhaps antagonistic to, each other, it is scarcely likely that the work, when completed, will be satisfactory. We have had ample experience of the troubles arising from this source, and think that Messrs. Young & Marten supply us with a relief, inasmuch as, furnishing all the requirements for the trade, we can hold them responsible for all articles supplied, from a "leaded cathedral light" down to the cement used for the cathedral foundations. This is a very heavy responsibility; but from what we have seen at Messrs. Young & Marten's Works we do not think they need shrink from it.

BUILDERS' BENEVOLENT INSTITUTION.

THE forty-fourth annual meeting of this Institution took place on Thursday, July 23, at the new offices, No. 35 Southampton Row, Bloomsbury Square, W.C. Mr. William Shepherd (president) occupied the chair, and amongst those present were Messrs. B. E. Nightingale, Thomas Stirling, W. J. Mitchell, W. Scrivener, E. B. Ellis and other friends of the charity.

Major Brutton (secretary) read the report, which stated that seven pensioners had died and four others had been elected, there being now twenty males and thirty-four females dependent upon the fund. The committee took the opportunity of earnestly impressing upon the subscribers, and those who had not hitherto assisted, that to maintain so many pensioners liberal annual subscriptions and donations were requisite from the members of the building and kindred trades. Unless this was complied with the number of pensioners would have to be reduced, or the yearly stipend curtailed. It was also the case that the usual annual contributions did not admit of the election of all who, by force of necessity, were compelled to seek the benefits of the charity, and, should the income not be increased, this difficulty could not be overcome. The receipts for the past year had been sufficient to meet the expenditure, largely owing to the exertions of the president (Mr. Shepherd), to whom the

committee expressed their obligations. The annual dinner will take place, by the favour of the Worshipful Company of Carpenters, in their hall on Thursday, November 5, when Mr. B. E. Nightingale, who has consented to accept the position of president of the Institution for the ensuing year, will preside.

The Chairman moved the adoption of the report, which was seconded by Mr. Thomas Stirling and unanimously agreed to.

The Chairman also proposed the following addition and amendment to the rules:—Rule 2, section 1*a*—"A firm shall exercise all the advantages of donations given in its own name, so long as any one of the original donors remains in the firm."

The motion was duly seconded, and agreed to *nem. con.*

Cordial votes of thanks were passed to the president, vice-presidents, trustees, treasurer, committee and auditors.

The Chairman then proposed that Mr. B. E. Nightingale be the president for the ensuing year.

Mr. W. Scrivener seconded the resolution, which was cordially received, Mr. Nightingale promising to do his utmost for the interests of the charity.

A hearty vote of thanks was passed to the Chairman for presiding, and the meeting separated.

WATERFORD CATHEDRAL.

THE cathedral of the Blessed Trinity, Waterford, has been re-opened after extensive improvements and alterations, which were commenced in January 1890. After the destruction of the ancient Danish and Anglo-Norman cathedral of Waterford in 1773, the use of maintaining the church distinctively as a cathedral church, with its services distinctive from those of parish churches, fell into abeyance. The new church was erected on the prevailing model in London of various churches built subsequent to the Great Fire, and adapted more to the importance of hearing sermons that the maintenance of choral worship. The Classic style in which it was designed by John Roberts in 1773 has been respected, and the important alterations that have been made are a development of the capabilities of the original building and its greater adornment rather than any violation of its original conception. The removal of the galleries must obviously be an improvement, and what consistently follows, the building up of the lower range of windows and the effective lighting from the upper windows is striking. The church was curtailed for congregational use, and its interior perspective view marred by its being divided into two sections, and the maintenance of a separate hall or vestibule, called a "nave," had no relation to a cathedral character. It has now been opened to the church by a great arch, and is incorporated with it for congregational purposes. With the removal of the cross-wall and the cross-gallery came the removal of the organ to the east end and neighbourhood of the choir. With it went also the dark closets called "stalls," formerly under the gallery.

At the east end of the church the new choir fittings are of solid oak. The chancel floor is of Italian mosaic, after the architect's general plan. The arms of the See of Waterford and the device of the capitular seal appear on either side, and a curious emblem of the Trinity is adapted from an ancient one found on a token among the ancient burials in Christchurch, Dublin. The altar rails are of gilded wrought ironwork, of Italian design, executed by Messrs. Singer & Sons, of Frome, Somerset, and are surmounted by a handsome brass rail. The sanctuary walls are lined with red Cork marble and carved Caen stone, as a dado that corresponds with the pedestals under the nave columns. On the walls will be placed two marble tablets, one of which states that the sanctuary floor is a memorial of the late Mr. and Mrs. Meara, of May Park. On the other will appear the following short memorial of the cathedral:—"The Danish Christchurch, or cathedral of Waterford, was founded here by Ragnvald, son of Sigtryg, the Norseman, circa 1050. It was extended by a choir and adorned by the Anglo-Norman invaders in the Early English style, circa 1220. There were added to it in the fourteenth and fifteenth centuries Trinity parish church and the chapels of St. Nicholas, St. Saviour, St. Catherine and St. James. These buildings, the foundation whereof yet remains beneath the present floor, were pulled down in 1773. The new cathedral completed 1773—John Roberts, architect; partially destroyed by fire, 1818; altered, adorned and adapted to cathedral use, 1891—Thomas Drew, R.H.A., architect." The old tesselated marble floors have been relaid in the long central passage from the west end to the choir. Arrow marks cut in the old flagging of the side aisle have been found, which indicate where the limit of the Anglo-Norman choir formerly was and the west end of Trinity Church began, and probably has reference to ancient rights of burial. The west entrance doorway, not yet erected, will have some association of interest. A more imposing portal of modern design might have been conceived, but it has been decided to accept the gift of the

Board of Trinity College, Dublin, of a doorway, some 180 years old, recently removed from the college library, and made of stone from Scraboh mountain, co. Down. When restored and set up it will be consistent in style at least with the cathedral. Architraves have been added to the windows, formerly rude apertures in the walls, and the windows have been filled with mullions and new glazing of leaded cathedral glass. The walls have been coloured in two tints, divided by a carved cornice taken from the old gallery front. The nave has been reseated with newly-constructed benches out of the materials of the old ones. The monuments have been cleaned and restored throughout, and great care has been taken that no relic of the old cathedral should be necessarily removed from it. Mr. A. P. Sharpe, Dublin, has been the contractor for the whole work at a cost of about 4,000*l.* The carving is by Mr. Henry Emory, of Dublin. The lectern, modelled by him, is executed by Messrs. McLoughlin, brassworkers, of Dublin.

THE BIRMINGHAM HYDRAULIC STATION.

ON Saturday, the 18th inst., the Mayor of Birmingham, in company with Sir Thomas Martineau and other members of the City Council, opened the hydraulic station which has been constructed in Dalton Street for the purpose of supplying hydraulic lifts with a higher pressure of water at a reduced cost both to the consumer and the Water Department of the Corporation. The Mayor, prior to starting the works, pointed out that sixty years ago there was no water-supply in the hardware village of Birmingham—a name which was fully justified at that period. London had a public water-supply in Queen Elizabeth's reign, and if one looked back at what the cities of Italy did in bringing water from very long distances, it must be admitted that Birmingham was then behind the times. August 1831 was the date of the first public water-supply in the town. It was needless to recapitulate what had been done in that direction since that time. The supply had been increased from year to year as the necessity arose. It was in 1888 that the committee first had under consideration the further development of the supply as it affected hydraulic lifts, but nothing was definitely done until March 4, 1890, when a report was presented to the Council recommending a new high pressure of 700 lb. to the inch, instead of 70 lb., the idea being to effect economy both for the Water Department and for the owners of hydraulic lifts. This matter was still in its infancy, although there were mains laid down through a few of the central streets, where naturally land was most valuable, and buildings accordingly consisted of more storeys than in the outside districts. He thought there was a great future for the system, judging from the use it was put to in London and Liverpool. Mr. Gray stated that more rent was obtained for some of the upper floors of the high buildings in these cities because the lifts made them easy of access, and they were quieter and cleaner than the lower floors. He (the Mayor) hoped the Council would put a good hydraulic lift in the Council House, for the demand for rooms on the ground floor was in excess of the accommodation, whilst there was a large amount of space in the upper storeys which might be used if such a lift was provided.

Alderman Sir Thomas Martineau said he believed the step they were now taking in the Water Department was a new departure for municipal corporations. It was not on so large a scale, of course, as some of the departures taken by Birmingham in the past, but it was a new one for a corporation to take. There had been establishments of the kind set up in some towns, but the work had been in the hands of public companies. He wished to point out that the inauguration of this movement was forced upon the Water Committee by the necessity of economising the water. For some time past there had been lifts in the centre of the town, and as they increased with the lofty buildings erected it became necessary to increase hydraulic pressure. In the five years between 1885 and 1890 the number of lifts had been doubled, and the enormous expenditure of water involved was a strain upon the domestic supplies. Hence the present system was developed with a view to economising the water consumed, so that now the lifts could be better and more cheaply supplied at one-tenth of the water formerly used. The first cost of constructing lifts served by the hydraulic power would be much less than formerly, and there would be a great saving in the working of the lifts, while the supply would be more regular and powerful than hitherto.

Mr. Gray, the engineer, at the request of the Mayor, gave a brief explanation of the works. He pointed out that a lift which now cost 16*l.* or 17*l.* a year would cost 13*l.* under the present system, and the saving to the department would be the difference between the cost of 7,000 and 70,000 gallons of water. It would pay consumers to alter their machines so that they could adopt the new system, which would be less costly and the lifts would be worked at more speed. The saving on a lift now costing 25*l.* a year would be about 9*l.* a year. Mr. A. R. Dean

was the first to have his lifts worked by the higher pressure, and his lift would go up a distance of 60 feet in half a minute.

The machinery was then set in motion and inspected by the company.

THE LAW OF "COMMON EMPLOYMENT."

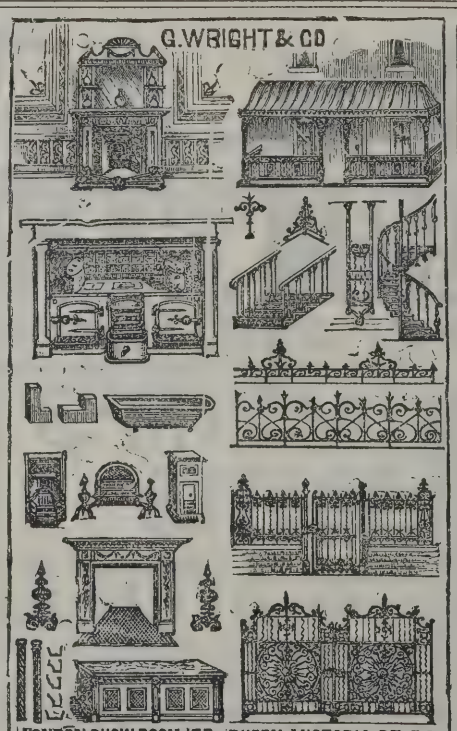
ON Tuesday in the House of Lords, before Lord Herschell, Lord Watson and Lord Morris, the important case of Johnson (pauper) *v.* W. H. Lindsay & Co. was heard.

This was an appeal from a decision of the Court of Appeal affirming a judgment of the Divisional Court. The action, says the *Times*, to which we are indebted for the following report, which raised a question of great importance as to the extent and operation of the doctrine of common employment, was brought by the appellant, a workman in the employ of Messrs. Higgs & Hill, to recover damages for personal injuries which he sustained through the alleged negligence of the servants of the respondent, who were at the time of the accident engaged in carrying out a contract for the construction of fireproof flats and floors in a building which the appellant's employers were erecting. The respondents disputed the appellant's claim, on the ground that he was engaged with their servants in a common employment. At the trial the jury found a verdict for the appellant, with 50*l.* damages, but that verdict was set aside and judgment entered for the respondents by the Queen's Bench Division, Mr. Justice Manisty, who took part in the judgment, remarking that the question as to the common employment was a very large and important one, and expressing a hope that it would be decided by the House of Lords. The decision of the Divisional Court was subsequently affirmed, on appeal, by Lord Justice Cotton and Lord Justice Lopes, the majority of the Court of Appeal, Lord Justice Fry dissenting. The case was argued some time ago, when judgment was reserved.

Lord Herschell, in the course of his judgment, said :—The ground upon which judgment was entered for the respondents was that the plaintiff at the time of the accident was engaged in a common employment with the servant of the defendants, whose negligence led to the disaster, and that the defendants, therefore, could not be held liable for his negligence. This renders it necessary to examine the facts relating to the employment of the appellant, and of the person whose negligence was found by the jury to have caused him injury It appears that Messrs. Higgs & Hill had entered into a contract with the Workmen's Dwellings Association, of which Mr. Burden was architect, to erect a block of buildings according to the specification furnished by him. The specification on which the contract was based contained a provision in these terms :—

"Provide the sum of 215*l.* net to be paid Messrs. Lindsay & Co., of the Paddington Iron Works, No. 14 South Wharf, Paddington, or any other firm approved by the architect, for fireproof flats and floors to roofs and laundries laid and fixed complete. The contractors are to allow Messrs. Lindsay the use of their scaffolding, and to provide them any needful attendance for the carrying out of their work, and are to work with them as may be necessary for the due despatch of their work. The work in respect of which this provision is included is to be carried out in accordance with a specification and instructions to be furnished by the architect."

It also contained the following clause :—"Power for other tradesmen to perform works. In order to carry out those works specified to be executed by other tradesmen, and for which provisional amounts are included in this estimate, the contractors are to allow free access to the premises and all reasonable facilities to such tradesmen for carrying out the several works reserved for them to perform."



Prior to the contract with Higgs & Hill being entered into, the architect of the building owners had obtained an estimate from Messrs. Lindsay & Co. for the fireproof flats and floors, the amount of estimate, which was headed "Workmen's Dwellings Association Company, R. H. Burden, Esq., architect," being the sum of 215*l.*, for which, as above mentioned, Higgs & Hill were to make provision in their estimate for the work upon the basis of which the contract with them was shortly afterwards entered into. The only other facts necessary to be stated are that there were, as far as appears, no communications between Higgs & Hill and Lindsay & Co. before the latter commenced their work, and that it was the architect who advised them that the buildings were sufficiently advanced to enable them to commence the work for which they had given him an estimate. It should be added that payments were made to Lindsay & Co. through Higgs & Hill. Upon this state of facts it is, I think, clear that the appellant was in no sense the servant of Lindsay & Co. It follows, therefore, that, if it is essential to the defence of common employment that the person suing should himself be the servant of the master by whose servant's negligence the injury has been caused, the defence cannot be sustained in the present case. And, upon a review of the authorities, I am unable to entertain any doubt that this is essential. Lord Cranworth, in delivering his opinion in this House in the case

of Bartonshill Coal Company *v.* Reid, thus states the rule established in this country :—

"When several workmen engage to serve a master in a common work, they know, or ought to know, the risks to which they are exposing themselves, including the risks of carelessness against which their employer cannot secure them, and they must be supposed to contract with reference to such risks."

The law is laid down in substantially the same terms by Lord Blackburn in Howells *v.* Landore Steel Company (10 L.R. Q.B. 62), and by Chief Justice Erle in Hall *v.* Johnson (3 H. and C. 594), who, in delivering the judgment of the Exchequer Chamber, said :—"The case falls within the principle established not only in this country, but also in Scotland, Ireland and America, that a servant, when he engages to serve a master, undertakes, as between himself and his master, to run all the ordinary risks of the service, including negligence on the part of a fellow-servant when he is acting in the discharge of his duty as a servant of him who is the common master of both."

And in the recent case of Swainson *v.* North-Eastern Company, Lord Bramwell said :—"We must consider what obligations a servant takes upon himself. It is sometimes said that he contracts to take upon himself the risks of his service, but the proposition may also be stated as follows, namely, that he has not stipulated for a right of action against his master if he sustains damage from the negligence of a fellow-servant. The two forms of the proposition seem to me substantially the same : in either case it is necessary to prove that a relation has been established between the person who complains and the master of the person who does the injury."

The present Master of the Rolls in the same case thus expressed himself :—"I think that the authorities bear out the proposition laid down in the Exchequer Division—that in order to give rise to the exemption there must be a common employment and a common master. It is not necessary that there should be a common service for a definite time or at fixed wages, for the exemption exists in the case of volunteers and of other persons, where plainly there has been no contract for payment ; a volunteer puts himself under the control of another person, and in respect of that other person he is for the time being in the position of a servant."

These authorities are sufficient to establish the proposition that unless the person sought to be rendered liable for the negligence of his servant can show that the person so seeking to make him liable was himself in his service, the defence of common employment is not open to him. Such service need not, of course, be permanent or for any defined term. The general servant of A may for a time or on a particular occasion be the servant of B, and a person who is not under any paid contract of service may, nevertheless, have put himself under the control of an employer to act in the capacity of servant, so as to be regarded as such. This, as has been pointed out, is the position of a volunteer. But it is obvious that if the exemption results, as it does according to the authorities I have cited, from the injured person having undertaken, as between himself and the person he sues, to bear the risks of his fellow-servant's negligence, it can never be applicable when there is no relation between the parties from which such an undertaking can be implied. There are other considerations which point in the same direction. It must be remembered that whilst a servant contracts with his master to bear the risks of the negligence of his fellow-servants there is, as has been more than once laid down, a corresponding duty on the part of the employerto take due care to select competent servants. And it would be most unreasonable to hold that he is exempt from liability for his servant's negligence in any case where he is not under this obligation. But I do not see how such an obligation can arise otherwise than from such contractual relation. The obligation and the exemption appear to me to be correlative, and to be implied from the relation of master and servant created between the parties. The language used by Lord Cairns in Wilson *v.* Merry was much pressed upon your lordships. It appears to have been supposed to countenance a wider exemption than is to be deduced from the other authorities to which I have referred. Lord Cairns, in delivering his opinion in this House, said :—

"I would only add to this statement of the law, that I do not think the liability or non-liability of the master to his workmen can depend upon the question whether the author of the accident is not or is in any technical sense the fellow-workman or *collaborateur* of the sufferer. In the majority of cases in which accidents have occurred, the negligence has no doubt been the negligence of a fellow-workman, but the case of the fellow-workman appears to me to be an example of the rule and not the rule itself. The rule, as I think, must stand on higher and broader grounds." But it is clear to my mind that when Lord Cairns used this language he was only intending to repudiate the contention put forward by the appellant in that case, that the rule applied exclusively to workmen of the same grade actually employed in a common labour, and had no

application where the person whose negligence was complained of was in the position of a manager not taking part in manual labour, who was, in fact, the employer's *alter ego*. Other passages in the noble and learned lord's opinion indicate, I think clearly, that he did not intend to state the law differently from Lord Cranworth, whose opinion in Bartonshill Coal Company *v.* Reid he quotes with approval. It is said, however, that the case of Wiggett *v.* Fox is decisive in favour of the respondents, and this view was adopted in the courts below. With deference to the learned judges who have entertained this view, I am quite unable to concur in it. If the law there laid down would determine the present case in favour of the respondents, I should feel bound to reject it as inconsistent with all the other English authorities. The plaintiff in Wiggett *v.* Fox was the administratrix of a servant of a sub-contractor who had been employed by the defendants to do a part of the work included in their contract; it was held that he was a fellow-servant of the servant of the defendants whose negligence caused him injury, that the sub-contractor and his servants had become the servants of the contractor. The ground of this decision was explained by Mr. Baron Channell, in Abraham *v.* Reynolds, to be that it was proved that the deceased was paid by the defendants, and that the defendants had a control over and power to dismiss the plaintiff though engaged by the sub-contractor. It is unnecessary to consider whether this view of the facts was correct, though the propriety of the decision has been more than once doubted, and notably by Chief Justice Cockburn in Reurke *v.* The White Moss Colliery Company, for a decision resting on such a view of the facts can, as it seems to me, have no application to the present case. In the first place, I do not think that Lindsay & Co. were sub-contractors under Higgs & Hill; I think they had an independent contract with those who were employing Higgs & Hill. In the second place, even if they are to be regarded as in some sense sub-contractors under Higgs & Hill, I think it is impossible to say that the servants of Higgs & Hill were the servants of Lindsay & Co., or that they had put themselves under the control of Lindsay & Co. to act as their servants, or were in any way acting as such at the time of the accident. It only remains for me to notice the recent Scotch decision in the case of Woodhead *v.* the Gartness Mineral Company, which was naturally much relied on by the respondents. Lord Justice Lopes stated in the court below, I think quite correctly, that this decision carried the principle of common employment much further than was warranted by any of the English authorities, and it appears to me to be a development of the doctrine which is really in antagonism with cases which have been decided in this country. It eliminates altogether the element that the injured man and the man doing the injury must be in the employ of a common master, and treats as unimportant that which I consider to be of the essence of the exemption, that is to say, the mutual undertakings between the employer and employed to be implied from the relationship of master and servant constituted between them. I think the judgment appealed from ought to be reversed and the judgment entered for the plaintiff restored.

Lord Watson: This action was brought by the appellant for damages in respect of personal injury sustained by him through the negligence of workmen in the service of Lindsay & Co., the respondent firm. It is admitted that at the time of the accident the appellant was a labourer in the employment of the firm of Higgs & Hill, and the only defence set up by the respondents, which is now insisted on, was thus stated in their pleadings:—"The plaintiff was a workman and was a fellow-servant of and was engaged in one common service and employment with certain of the defendants' servants, who were also workmen and competent to do their work, and the said injuries, if caused by the negligence of any person or persons for whose negligence the defendants would be answerable (all of which is denied), were caused by the defendants' said servants while they and the plaintiff were such fellow-servants, and engaged in such common service and employment, and in the course thereof, and not otherwise, without any personal negligence or interference on the part of the defendants."

The terms of that plea render it necessary to determine the precise relation subsisting between the appellant and the workmen by whose negligence he was injured. The ascertainment of that relation depends, not upon conflicting testimony, but upon facts which are not controverted, and upon documentary evidence. Messrs. Higgs & Hill, the appellant's employers, were contractors for building a block of artisans' dwellings, in accordance with plans and specifications prepared by Mr. Burden, the owners' architect. Part of the contemplated work consisted of fireproof flats and floors of concrete for laundry purposes, to be completed on the "Lindsay" system, so-called in consequence of the respondents being specialists in that kind of work. In the specification the details of these fireproof flats and floors are entered under the heading, "power for other tradesmen to perform works," and there is a general provision that "in order to carry out those works specified to be executed

by other tradesmen, and for which provisional amounts are included in this estimate, the contractors are to allow free access to the premises, and all reasonable facilities to such tradesmen for carrying out the several works reserved for them to perform." The only other obligations which the specification imposes upon the contractors with regard to the fireproof flats and floors are that they shall provide the sum of 215*l.*, to be paid to the respondents or any other firm approved by the architect, and that they shall allow the respondents or such other firm the use of their scaffolding, and provide them with any needful attendance for carrying out their work, and also work with them as may be necessary for the due despatch of their work. Mr. Burden transacted with the respondents directly and received from them an offer to execute the laundry work for 215*l.* He did not, as he explains in his evidence, absolutely bind himself to them, having reserved the right to employ another firm if he chose; but, when the building was ready for their work, he directed them to proceed with it, which they accordingly did. The respondents had no contract with Higgs & Hill, and they came under no obligation either to receive directions from that firm or in any way to submit to their control. The evidence does not show or even suggest that, in point of fact, Higgs & Hill ever attempted to interfere with the respondents' work, or to assume control over their servants who were employed in its execution. It is not disputed that the appellant was engaged and paid by Higgs & Co., or that the workmen through whose fault he was injured were engaged by, and received their wages from, the respondents. At the time when he was injured the appellant was clearing away rubbish from the lower storey of the building, in the course of his duty as the servant of Higgs & Hill, who had undertaken to perform that operation. The respondents' servants were raising buckets of concrete to the topmost storey, for the purposes of their contract with Mr. Burden by means of a pulley and tackle, supplied by Higgs & Co., as required by the specification, when, through want of due care on their part, a bucket fell upon and injured the appellant. I do not doubt that the appellant and the servants of the respondents, though engaged in different departments of work, were yet employed in furtherance of the common end of completing the block of dwelling-houses. Nor do I doubt that, if they had all been servants of the same master, the appellant would in law be held to have accepted the risk of his fellow-servants' negligence, and could have had no claim for reparation, except against the workmen who injured him. But there is, in my opinion, no ground for the suggestion that the respondents' servants were, in any sense whatever, the servants of Higgs & Hill, and therefore fellow-servants of the appellant.

(*To be continued.*)

PATENTS.

SHOTLEY BRIDGE.—Aug. 15.—For Constructing Evaporating Furnaces. Messrs. John Annandale & Sons, Shotley Bridge.

IMPROVED

FLAT BRICK FIRE-PROOF FLOORS.

Transverse Section.

Longitudinal Section.

NO THRUST ON WALLS.

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with moulded projections protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known

The soffits of the bricks are specially prepared to key up the ceiling plaster. No laths or counter ceiling are necessary. They are not affected by water, acids, or alkalies, and they may be fixed during the progress of building, thus dispensing with the use of internal scaffolding.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost of a building with floors of this construction does not exceed that of one with the ordinary combustible timber floors of corresponding strength.

BUILDING AND BUILDERS.

A SUPPER was recently given at the Lion Hotel, Caerhowel, by Colonel Harrison, to the men employed upon the works at Caerhowel Hall, which is now undergoing alterations and considerable enlargement, under the direction of Mr. W. H. Spaull, F.R.I.B.A., Oswestry, the contractor being Mr. W. H. Thomas, Salop Road, Oswestry. The chair was occupied by Mr. Frank H. Shayler, assistant architect to Mr. Spaull.

THE Bombay Corporation, the *Indian Engineer* says, recently met to discuss the building by-laws, with a view to preventing in future jerry-building, which has had such fatal results within the last few years. Mr. Gostling, the architect who had given scientific evidence in the recent cases of collapse, attended to advise the Corporation. One draft by-law provided for the use of good bricks and stone, good mortar, good lime, clean sharp sand, good cement. Mr. Gostling thought the adjectives in each case unnecessary, as the materials mentioned, to be worthy of the name at all, must be good. Dr. Viegas moved the omission of these words, and by a majority it was carried. Colonel Mereweather, R.E., then proposed that since they gave builders, by this resolution, permission to use whatever kind of material they chose, the draft by-laws now before the Corporation be abandoned. Colonel Wilson left the meeting by way of protest, and a further resolution to omit the word "good," as applied to foundations, was carried. Further discussion was postponed.

STEPS are being taken for the erection of a Conservative club at Bedworth. The building, which will be erected on a plot of ground adjacent to the Coventry Road, will include a reading-room, billiard-room, a large room for meetings, &c., capable of holding some 400 persons. The estimated cost is 600*l.*

CLEAN. CONTINUOUS. **OVENS** ECONOMICAL. SMOKELESS.
"The BEST I have had to do with."
B. WEBSTER, Marsh Gate, Leeds.
Alex. A. Anderson, Doncaster.

NEARLY two years ago the foundation-stone of a new church at Barmouth was laid. The site, a shelf of rock above the arcade, was levelled, and upon it a handsome structure has been gradually approaching completion. Through a fault in the rock the weight of the masonry has caused a slight subsidence at one corner, and a crack is visible in the wall. Precautions have been taken to prevent any further injury to the church by surrounding the foundations with several tons of concrete.

THE iron church at the foot of the Windmill Hills, Gateshead, after doing duty for some fifteen years, is to be replaced by a permanent structure. The architect of the new church is Mr. Stephen Piper, County Chambers, Newcastle, and the building will consist of nave, transepts, chancel, chancel-aisle, organ-chamber and vestry, with heating-chamber underneath. The aisles are arranged so as to admit of future extension, but at first they will be used as passages.

THERE was a large and representative attendance of builders present at the burial of the late W. H. Cowlin, of Bristol, which took place at Arno's Vale Cemetery. Among them were Mr. E. T. Hatherly, president of the Bristol Master Builders' Association; Mr. Hayward, president of the Bath Master Builders' Association; Mr. F. J. Dove, of London, of the National Master Builders' Association. The Bristol Society of Architects was represented by the president, Mr. H. Crisp and Mr. W. E. Jones, hon. secretary.

RAPID progress has been made in the restoration of Dunblane Cathedral. The choir has been in use for many years, the nave has been roofless till now for three centuries. It was found that the tops of the choir wall were more decayed than was expected, and part had to be taken down and rebuilt. This is now finished. In the south wall of the choir there are six large windows, and the tracery on the top of the four in the centre has been altered to correspond with what is considered the original. The east gable, containing the great east window, is surmounted on both sides by a small turret or spire.

TRADE NOTES.

WE understand that Messrs. John Gibbs & Son's patent "Weatherproof extractors" have been used for ventilating the new lying-in ward for the Toxteth Union, of which Mr. W. W. Thomas, of Liverpool, is the architect.

A NEW church has been erected at Alnmouth, and the ventilation has received the most careful consideration, the extraction of the vitiated air being effected by the direct-acting turret ventilator of the Climax Ventilating Company, 15 Great George Street, Westminster, treated so as to make it a feature of the building.

A VERY handsome stained-glass west window has just been erected in St. James's Church, Antrim Road, Belfast, in memory of the late Sir John Preston, by his widow and family. The window, which is universally admired, was executed at the Hogarth Studios, Fitzroy Square, London.

AT the sale by auction, on the premises of the Irish Portland Cement Company, Dublin, of the machinery, plant, sheds, &c., employed in the manufacture of the cement, among the lots sold were the chief engine for 400*l.*, the boiler for 200*l.*, the driving shafting apparatus for 150*l.*, the second engine for 100*l.*, and boiler in connection for 90*l.* Sixty-five tons of cement fetched 149*l.*, three stone-breakers fetched from 40*l.* to 53*l.* each, and a pulveriser 65*l.* The pipes in connection with the boilers brought 100*l.* It is stated that the principal part of the machinery is purchased with the intention of restarting the works.

THE Watch Committee of the Worcester City Council recommend the appointment of a canvasser for the purpose of ascertaining how many of the inhabitants are likely to take electric light if provided.

THE Birkenhead Health Committee recommend the Council to construct two refuse destructors, one in Birkenhead and the other in Tranmere.

AT the meeting of the Birmingham Board of Guardians the following tenders were accepted:—From Messrs. Currall & Lewis for 48*l.* 17*s.*, for repairing the boundary wall at infirmary; and from Messrs. Norton & Co. for 575*l.*, for painting the exterior of the infirmary.

MESSRS. R. WAYGOOD & CO., lift manufacturers, of Falmouth Road, Great Dover Street, S.E., on the Friday before the Bank Holiday arranged an outing for their employés on what may be called the blue-ribbon system, so as to avoid the risk of harmony being upset by the too free indulgence of their men in intoxicating drinks. Messrs. Waygood & Co. defrayed the expenses also, in order to discourage the application for donations from other firms. Any canvass for such donations was prohibited, but the company invited not only

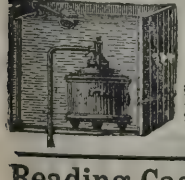
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

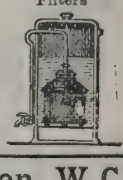
Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.



We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our DESIGNS, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.



A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, J. H. PICKUP & CO.

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE
LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.
Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.
Price, £1 10s. and upwards Portable Filters on this System, £1 5s. to £3.
Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4*s.* 6*d.* and 6*s.* each. Household and Fancy Filters, from 10*s.*
Water-Testing Apparatus for detecting Impurities in Water, 10*s.* 6*d.* and 21*s.* each.
157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

Reading Cases for the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

their employés, but the wives and children also, to take part in the excursion. The party had their outing to Richmond, where, at the Castle Hotel, about 430 sat down to dinner. The afternoon was spent in amusements, a good tea being provided later, and on the return London Bridge was reached at 10 P.M. The system is one that might well be adopted universally, though we should be sorry to think that all depends on the blue-ribbon system for the preservation of harmony.

THE Town Council of Aberdeen have agreed to spend 675*l.* on the lowering of the levels in Union Terrace, with the view of completing the improvement now being carried on in that locality. The Council deferred in the meantime the proposal to spend 37,000*l.* on the improvement of the Gallowgate.

THE Birmingham Markets and Fairs Committee have accepted the tender of Mr. C. H. Horton, of Church Street, Brierley Hill, for the construction of the new pig-market in Montague Street.

THE Aberdeen Town Council have sanctioned the erection of a new canteen at Castlehill barracks, at a cost of 1,760*l.*, the contractors being Messrs. D. Macandrew & Co.

AMERICAN NOTES.

THE Charleston, S.C., *News and Courier* says:—The forests of the south are falling like wheat before the reaper's scythe. The annual area of destruction is measured by thousands of square miles. The "progress" in this field is a steady and rapid march toward the ruin of our forest resources, which are being "developed" off the face of the earth. The finest timber lands remaining in the country are being swept of their trees, without regard to their real value or to the future needs and prosperity of the section to which they belong, and the work of devastation is being done with the consent and by the hands of the people of the south themselves. Acres of wood land are sold for the price of a few trees growing on them, and their owners as a rule are content to part with their inheritance for the small compensation they receive for cutting down the trees and carting them to the nearest saw-mill. The business is a paying one for the north, of course, but it is a reckless waste so far as the south is concerned.

THE Wheeling (West Virginia) planing-mill men and builders report, the *North-Western Lumberman* says, the largest building season that the city has ever known. There are many new business houses in course of construction and no end of small dwellings. The cost of the buildings erecting and to be erected this season is estimated at about 1,000,000 dols., with a good prospect that that sum may be exceeded.

AS the result of a recent survey of the railway bridges in the State of New York, 669 have been condemned and 130 will require to be entirely rebuilt. There are in all 2,000 bridges, but in America it must be remembered the use of wood for bridges is general.

THE new 125-ton steam-hammer just completed by the Bethlehem Iron and Steel Company, Bethlehem, Pennsylvania, is said to be the largest ever built. The hammer was designed by Mr. John Fritz, superintendent of the company, and stands some 60 feet high. It covers a floor surface 42 feet square, and is of the usual A-frame construction. The steam cylinder is 6 feet 6 inches in diameter, and has a stroke of 16 feet 6 inches. The total weight of piston, piston-rod, ram and die amounts to 125 tons. The anvil is made up of twenty-two solid cast-iron blocks, averaging about 70 tons each in weight. The anvil-block upon which the material is to be hammered is faced with steel, and measures 11 feet in length, 6 feet in width at bottom, 2 feet in width at top, with a depth of 4 feet 6 inches.

THE *Engineering Record* says:—Joseph Thompson, a well-known contractor and builder, died at New York on July 16. He superintended the construction of the Mutual Life Building, the United States Trust Company's Building and the Wilks Building in Wall Street, and at the time of his death was in charge of the erection of the Greenwich Savings Bank.

THE Welsh societies of Chicago, the *Journal of Commerce* says, have been quietly perfecting arrangements to hold in this city, during the World's Fair, their national feast of music and literature, the Eisteddfod. To this end it is necessary to build an auditorium with perfect acoustic and optical properties and capable of seating 20,000 persons.

THE largest compound pumping engine ever built at the Lehigh Valley shops at Hazleton, Pa., the American *Manufacturer* says, is now ready to be shipped to York Farm colliery. Its weight is 100,000 lbs., or 50 tons, and its estimated cost to the company is 6,349 dols. It has power to raise water 450 feet perpendicular, and will be placed in position at the York Farm mine. The Hughes Steam Pump Company, Cleveland, O., lately put in an immense pump in an iron mine at Iron Mountain, Mich., of 2,000,000 gallons capacity, style, compound condensing, 24-inch high pressure, 40-inch low pressure, 12-inch

outside pack plungers, 18-inch stroke, using air pump and condenser; weight, 24 tons. This pump is raising water 500 feet through a 12-inch pipe, and giving unquestioned satisfaction.

THE first experiment in electric railways in Minnesota outside of city passenger traffic is to be made between Stillwater and St. Paul, twenty-four miles. It is intended to have the road in operation for both freight and passenger traffic by October 1.

IT is proposed to build an electric road to Price Hill, a western suburb of Cincinnati, at a cost of 150,000 dols.

A STEEL bridge is being constructed by the Union Pacific across the Columbia river at Vancouver, Wash. The length from the Washington to the Oregon shore will be 6,000 feet, and the draw pier will be over 400 feet long. The cost of the structure will be over 4,000,000 dols.

ANOTHER Leary raft, the largest ever floated, containing 3,500,000 feet of lumber, and far exceeding its predecessor, known as the Joggins raft, has reached New York in safety from St. John, New Brunswick. The lumber of which it consists would have loaded up thirty-five ordinary schooners engaged in the trade. This raft was towed in sections connected with chain cables.

VARIETIES.

THE Improvement Committee of the Halifax Corporation have decided that it is necessary to apply to the Local Government Board for a provisional order to alter, repeal and amend such of the local Acts in force within the borough as relate to new streets and buildings.

IT is stated that there have recently been a considerable number of cases of lead-poisoning at Whitwood and Hightown, part of Whitwood Mere township. The water used is from Wakefield. Iron pipes are now being substituted for lead pipes.

THE plans, &c., for the supply of the high levels of Killiney with Vartry water by means of pumping have been approved by the commissioners, who have decided to apply for a loan of 1,500*l.* to defray the cost of the work.

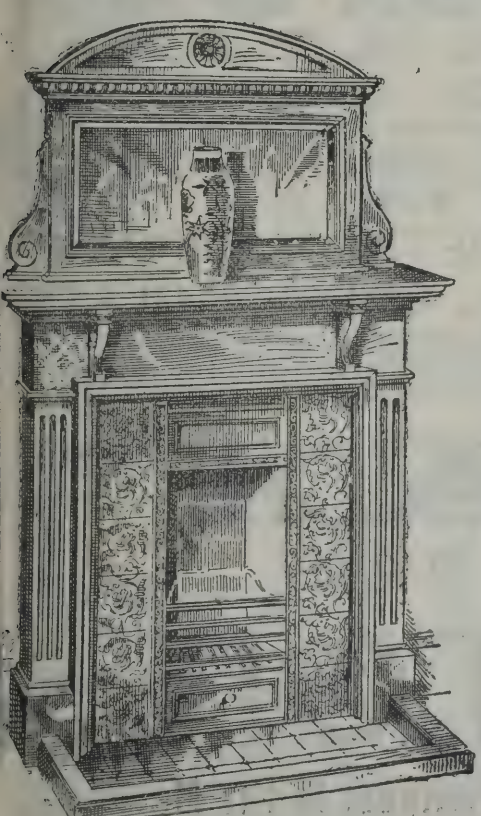
THE recommendation of the General Works Committee to purchase from Mr. George Worton his property in Earl Street at the price of 2,000*l.*, being part of the site required for the proposed new municipal buildings and public improvements, has been confirmed by the Coventry City Council.

IN connection with the proposed erection on the Market estate of a new technical school for Batley, Messrs. G. & J. Stubley, woollen manufacturers, have offered a subscription of 500*l.*, on condition that 3,000*l.* be raised.

PLANS have been prepared by the county surveyor, Mr. Vickers Edwards, for a new bridge over the Aire between Shipley and Baildon, estimated to cost 4,000*l.*

THE Local Government Board have sanctioned a loan of 3,650*l.* for the purpose of forming a new public cemetery for Rhyl.

A CLAIM against the Hull Corporation of 50*l.* in respect of each of 22 houses alleged to be depreciated in value by the construction of the Argyle Street bridge over the North-Eastern Railway, at Hull, has been decided by Mr. T. B. Thompson, C.E., arbitrator, who finds that the value of the property has been depreciated by the interruption of a free current of air, and by the erection of the bridge generally. He has awarded 8*l.* 10*s.* for each house.



UNDERGROUND workings on the estate of the Duke of Hamilton, are, it is reported, responsible for damage being done to the Town Hall and Burgh Buildings. The walls of the hall show several large cracks varying in length from 1 to 6 or 7 feet. The number and sizes of these fissures are becoming greater. The commissioners are negotiating for the purchase of the minerals below the buildings which have yet been left untouched, for the purpose of insuring their safety. It is supposed the damage already done has been caused by a "draw" subsequent to the workings in the vicinity.

AT the meeting of the Mines Drainage Commission, a letter was read from Mr. T. Hawksley resigning his position as arbitrator. Mr. Wilson Lloyd, chairman, regretted that Mr. T. Hawksley was resigning, for he was an able man, and had rendered great assistance to their engineers. He was a clever water engineer. The Chairman said all the arbitrators would resign, and new ones would have to be appointed under the new Act.

THE Corporation of Glasgow have purchased forty acres of ground adjoining Alexandra Park, with a view, it is understood, to the extension of the park. The price paid for the ground is 200*l.* an acre, being 8,000*l.* in all.

THE magistrates of Moffat have received a further remittance of 1,000*l.* from the executors of the late Mr. William

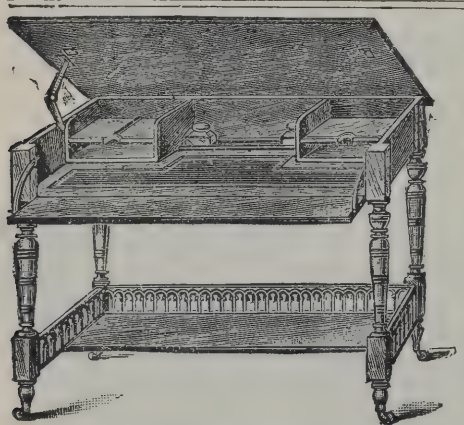
Proudfoot, of Natal and Craigieburn, Moffat, "for the benefit of the working men of Moffat."

THE Guardians of Alcester decided to engage Mr. Pritchard, C.E., to make an inspection of the Astwood Bank district, with a view of obtaining a supply of water for that place.

THE First Scholarship and First Prize at the Royal Agricultural College, Cirencester, has just been won by Mr. Arthur Noël Whitley, only son of the Director-General of the German Exhibition, for the fifth term in succession. He has also, for the second year in succession, gained the college challenge cup for athletic sports, and has been elected captain of the college football team for the coming winter.

THE "ECLIPSE" PAINT REMOVER.



WE have received sample tins from the proprietors of the above speciality, and can, from actual test, recommend it as a most efficient paint remover. It is prepared as a paste, the application of which immediately removes old hard paint of any thickness, enamel, varnish, and wall-paper from wood, stone or iron. It is also used for taking paint from baths, as well as from old wood-carvings. It is a disinfectant, and will not injure the surface or the paint afterwards applied; while as to price, we believe it compares favourably with any other in the market. These qualities should recommend the "Eclipse" Paint Remover to decorators, builders and others. The proprietors are The "Eclipse" Paint Remover Co., 1A Crescent, Minories, London, E.C., from whom samples and particulars can be obtained on application.

AUDLEY WATERWORKS.

NEW waterworks just completed at Audley, Staffordshire, have been formally opened. The parish, which contains a population of about 16,000, consists of a number of villages, scattered over the mining district of North Staffordshire. It was found necessary to obtain the water from the sandstone formation below the level of the deepest mines in the immediate neighbourhood in order to secure a constant and pure supply. In consequence of the scarcity of water, the local board some years ago adopted a partial scheme by which one part of the district was supplied; this has now been extended and the system just completed provides for a daily supply of 260,000 gallons. The works were planned by Messrs. Ford & Slater, surveyors, of Burslem, and the machinery was designed and constructed at Union Foundry, Kidsgrove, Staffordshire, now one of the branches of Messrs. Woodhouse & Rawson United, Limited, of 88 Queen Victoria Street, London, under the supervision of Mr. C. E. Masterman, A.M.I.C.E., the works manager. The pumping machinery is capable of delivering 20,000 gallons per hour into the high-service reservoir, through three miles of leading mains from a depth of 530 feet.

The pump-well is 100 feet deep, and is lined through with cast-iron tubbing in bracketed segmental rings each 5 feet deep and averaging ⅜ inch thick. This tubbing is belled out to a diameter of 7 feet at the top, where provision is made for receiving the guides by cast-iron girders and slide-boxes. There is a borehole 100 feet deep at the bottom of the well. The pump, which is of peculiar construction, is driven direct from the triplethrow crank-shaft by three long wrought-iron pump-rods attached to the bucket and crosshead. It consists of two buckets working in one gun-metal-lined barrel, the lower bucket being actuated by the centre pump-rod of wrought-iron which passes through the upper bucket and through a hollow steel sleeve. This sleeve is screwed into the upper bucket and also to the underside of the crosshead to which the two outer wrought-iron pump-rods are attached, thus enabling the upper bucket to work in a contrary direction to the lower one, and giving a continuous flow of water through the working barrel. The valves of the buckets are so constructed as to partly rotate at each lift. The water delivered from the pump is forced through one of Masterman's patent diaphragm condensers, fixed below the floor, fitted with "Credenda" steel tubes and having a cooling surface of 390 square feet. Immediately outside the engine-house is a cast-iron air-vessel, also a retaining valve and a relief valve, the latter weighted to release at a pressure of 300 lbs. per square inch. A "byepass" is arranged from the pump to the air-vessel by which the water can be carried past the condenser if it is desired to work the engine at high pressure.

The mains, which are of cast-iron, are of the spigot and socket type, and range in diameter from 8 inches downwards. They are about thirteen miles in length, and are provided with suitable valves and fire connections. The engines are of the compound coupled type, fitted with the above-described condenser, and are of 110 indicated horse-power when working at their normal speed of 75 revolutions, with a boiler-pressure of 70 lbs. The high-pressure cylinder is 12 inches bore, and the

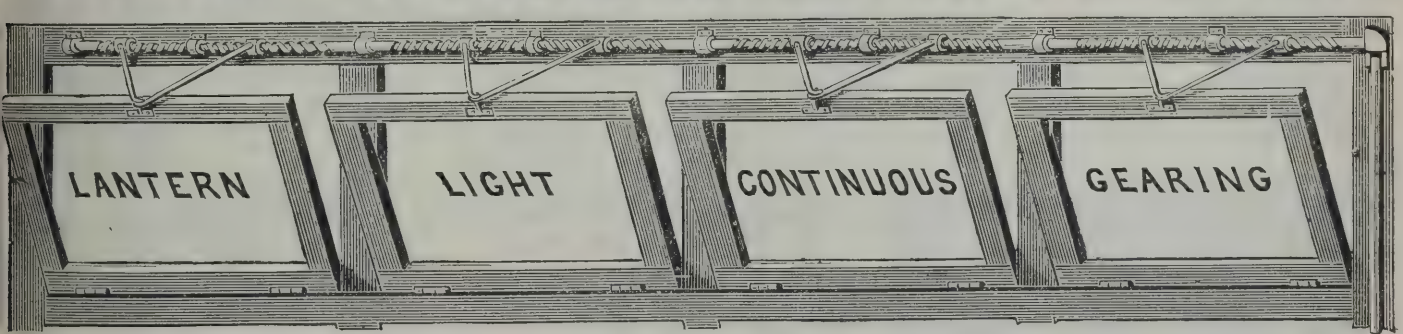
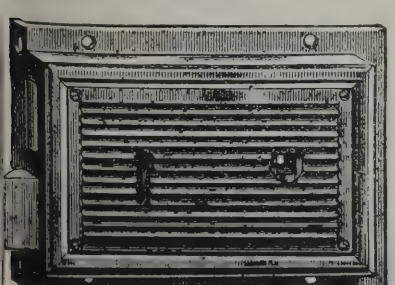
low pressure 22 inches, each having a stroke of 2 feet. They are steam-jacketted, lagged with mahogany and bound with brass bands. An] "Acme" governor fixed on the steam-chest regulates the steam-supply. Slipper-guides are attached to the ends of the piston-rods, and the connecting-rod and shaft-bearings are of gunmetal of ample size. The eccentric rods are constructed of steel tubes, and the shaft is of best hammered iron, while the three-throw crank-shaft is driven by a mortice wheel which takes motion from a pinion geared in the ratio of three to one. Steam is generated in two Cornish boilers each 6 feet diameter by 24 feet long, made of best Staffordshire plates and tested by hydraulic pressure to 120 lbs. per square inch; these are fed by a Cameron donkey pump placed in the engine-house and drawing water from a wrought-iron hotwell outside the house. In addition to this there are auxiliary pipes attached to the boiler-feed to prevent any possible interruption to the supply of feed-water. An arrangement in the roof of the engine-house facilitates the drawing out of the pump-rods when the buckets require changing, and a travelling-crane is fixed over the engine in order that any part of the machinery may be easily moved.

NORTH BRITISH ASSOCIATION OF GAS MANAGERS.

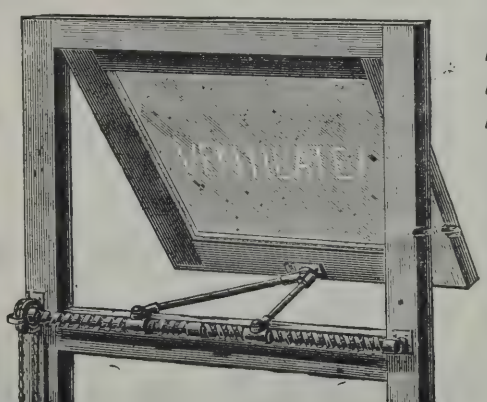


THE annual meeting of the North British Association of Gas Managers was held in the Victoria Room, Edinburgh, on the 23rd ult. There was a large attendance, presided over by Mr. R. Robertson, Bathgate. It was reported that the membership numbered 233, of which 151 were ordinary members, 61 extra-ordinary, 5 honorary and 16 associates. The funds were reported to be in a satisfactory condition.

Mr. J. M'Gilchrist, Dumbarton, on behalf of the Murdoch Memorial Fund, stated that the fund now amounted to 317*l.* 17*s.* 6*d.* Next year, being the centenary of the introduction of gas lighting, it was resolved to apply for leave to erect a bust to Murdoch, who was its pioneer, in the Wallace Monument, Stirling. This, it was explained, would not exhaust all the funds of the committee, and it was hoped that a still more worthy memorial to Murdoch might yet be erected.



A letter was read from Mr. Samuel Stewart, Greenock, last year's president, regretting his inability, through illness, to attend the meeting. Mr. D. Bruce Peebles, Edinburgh, resigned the office of auditor, and was elected an honorary member.



The President, in his opening address, said it was matter for congratulation that the demand for the commodity they manufactured and sold was still largely on the increase, notwithstanding the encroachments of rival illuminants, and that gas stocks were to day as firm as ever they were. They rejoiced that a good part of the increase was due to day consumption. The prejudices against gas as a cooking agent had been gradually removed, and what was claimed by them years ago was now admitted on all hands—that gas is the most economical, convenient and clean mode of cooking yet introduced. Looking from the past success of gas to its future, and remembering that this success up to the present had been due to its cheapness, reliability and convenience, they might question themselves as to the possibility of this increasing demand being reversed. They need not consider the possibility of any rival illuminant ousting gas on the score of reliability and convenience. What concerned them most was the danger of a decreased demand, induced by a necessity for raising the price to such a point as would give the more expensive and brilliant light a chance to supplant it. To reduce the present high standard of luminosity by the use of cheaper coal, that gas might be kept at a low price, would, in his opinion, be a false step, in the face of the continued demand for more light. The efforts put forth by their American brethren to produce gas of high luminosity, so as to compete more favourably with the electric light, confirmed the opinion of the majority of Scottish gas managers that the high standard illumination ought to be maintained, and showed them that there was perhaps, after all, a great amount of truth in what the chairman of one of the electric light companies said in explanation of the non-success of the new light in Scotland, namely, that it was there met by a strong competitor in the shape of the rich coal-gas supplied. Being brought face to face with the difficulty of producing a rich gas at a cheap rate, when cannel is rising in price, it was gratifying to see that there was a possibility of the removal of that difficulty. The activity shown by gas managers and chemists to practically apply the old theory of enriching coal-gas by oils was significant. That the difficulties hitherto encountered in that direction would ultimately be overcome they had not the least doubt. Success in that, combined with more economical methods of working, would enable gas to hold its own as the cheapest light for years to come. Unless the cost of producing electric light could be very much cheapened, they had no reason to fear its encroachments either in private dwellings or in their streets; and

JAMES HILL, 100A QUEEN VICTORIA STREET, LONDON, E.C.

cheapening seemed scarcely possible when they considered that at the present time over 90 per cent. of the power expended is converted into light. The labour trouble still clung to them, and it seemed that a solution of that difficulty would not be arrived at in a hurry. The spirit of unrest among gas workmen, as well as in other departments of labour, kept up by the paid agitator, was a matter of anxiety to the gas manager.

Mr. G. B. Hislop, Paisley, read a paper on "A new form of Gas Burner, especially adapted for gas-testing purposes." Mr. Hislop showed by experiments that in the majority of burners the orifices are usually drilled at much too high an angle for producing the greatest amount of luminosity. In a discussion which followed, Mr. Mitchell, Edinburgh, said he thought the burner shown was not so suitable for Edinburgh gas as for lower quality gas. Mr. A. Macpherson, Kirkcaldy, said there was nothing which would tend more to give satisfaction to gas consumers than a proper set of burners constructed on the principles which had been advocated by Mr. Hislop, suitable for all the different qualities of gas, and that those burners should be supplied to gas consumers by the companies or corporations. Mr. J. West, Manchester, said that every gas-burner ought to be governed, and in addition gas managers should educate their consumers as to what burners to use.

Mr. J. West, Manchester, then read a paper on labour-saving appliances in connection with mechanical stoking. He mentioned that one of his most recently fitted-up machines was in the Aberdeen Gasworks, which, he believed, had led to a great saving of cost in the retort-house. A discussion followed, in which Mr. Valon, Mr. W. Key, Mr. D. Terrace, Mr. T. D. Hall and others took part, all the speakers uniting in the opinion that Mr. West's machinery in Aberdeen, which they had all seen, worked most efficiently.

About two o'clock the meeting adjourned, and the company walked to the Edinburgh Gasworks, where they were received by Councillor Kinloch Anderson, who gave the gas managers a hearty welcome on behalf of the Edinburgh and Leith Gas Commissioners. On resuming, it was reported that the ballot for the election of office-bearers had resulted in the following being elected:—President, Mr. A. Macpherson, Kirkcaldy; vice-presidents, Messrs. T. D. Hall, Montrose, and Wm. Key, Tradeston Gasworks, Glasgow; committee, Messrs. J. M'Gilchrist, Dumbarton; Levi Monck, Partick, Hillhead and Maryhill Gas Company's works; and Alexander Smith, Aberdeen; secretary and treasurer, S. Carlow, Arbroath.

Mr. G. Love, Paisley, read a technical paper on "Experience on the construction and working of Regenerative Retort Settings." Mr. David Robertson, Dunoon, read a paper on "Unaccounted-for Gas," in which he gave it as his opinion that the cause of the unaccounted-for gas was chiefly to be found in the great leakage in service pipes and meters. Mr. W. Kay, Glasgow, said that in a town where he was once gas manager, they had two wet meters, both in the police office, which controlled the all-night and the half-night lamps. The gas company put on dry meters, and in the first year their account for gas consumed in the public lamps doubled itself. After that they found it to go down, and he and his assistants set themselves to ascertain scientifically what was the cause. They required to get goloshes, and with the aid of these they found that the police were in the habit of turning out the lamps upon which there were meters at a much earlier hour than the other lamps. It was agreed next year's meeting should be held at Dundee. Mr. D. Macfie, Edinburgh, read the last paper on "Regenerative Gas Lamps, with special reference to the lighting of large interiors." Mr. Macfie said that any ordinary regenerative gas lamp might be relied to increase the light from a given consumption of gas by 150 per cent.

THE MANCHESTER WATERWORKS.

THE Manchester Corporation, by invitation of the Waterworks Committee, have paid a visit of inspection to the waterworks in the Longdendale Valley. Five years have elapsed, says the *Manchester Guardian*, since the last occasion of the kind, and it was considered by the committee that, as many alterations and improvements have been completed since 1886, the younger members of the Council—those particularly who have been elected to represent the newly-incorporated districts—should be afforded an opportunity of seeing the important system of reservoirs and works which provide the city and district with water. Leaving the train at Woodhead station, an inspection was first made of the Etherow Weir and watercourses adjoining; also the watercourses at Heyden Brook and the Woodhead reservoir at Crowden. The spring watercourse at Crowden brook and the reservoirs of Torside, Rhodes Wood and Vale House were visited in turn, and the party had the great advantage of Mr. Hill's explanation of the system by which a supply of perfectly pure water is sent to Manchester for domestic consumption, whilst the turbid water coming from the hills in times of flood is collected in the two lower reservoirs

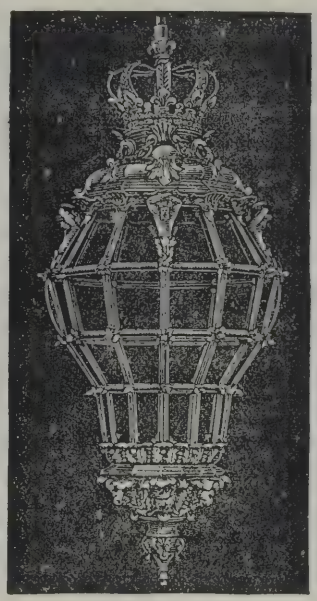
(Bottoms and Vale House) and sent down the Etherow as "compensation" for the use of the millowners. The gauge basin through which this water passes is placed at the foot of the Bottoms reservoir embankment near Tintwistle Bridge, and at this point the water is delivered into the river. By means of the gauge basin the compensation water is measured, the Corporation being required to deliver 16 million gallons daily during working hours for six days in the week. It was pointed out that this system of reservoirs and works, the property of the citizens of Manchester, is now absolutely complete, no extension or material improvement being now practicable, and that it is the most perfect and elaborate system in existence in the kingdom. Its total cost to the Corporation since the acquisition of the old water company's property forty-five years ago has been 3,138,152*l.*, which sum includes 533,561*l.* of purchase-money paid for the old works; and the area of supply, about 84 square miles, comprises the city of Manchester and twenty-four adjoining townships, whilst the population at present served numbers about one million. The average consumption of water is about 14 gallons per head per day for each person for domestic purposes, and seven gallons per head per day for trading purposes, the total consumption being about 21 million gallons per day.

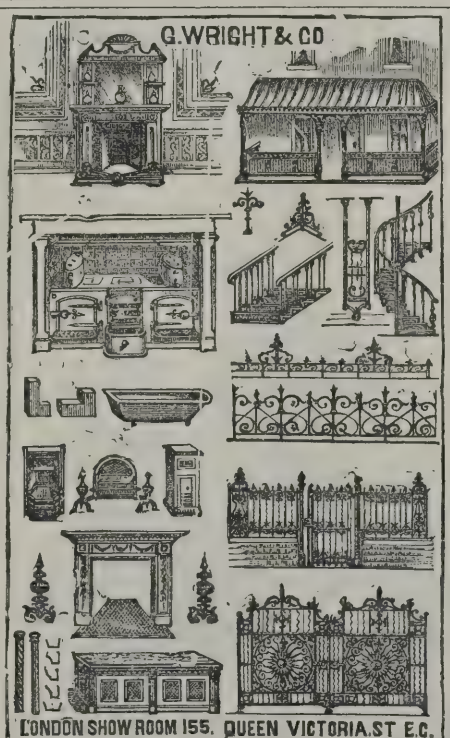


MESSRS. JOHN GIBBS & SON.

WE stated by mistake last week that the ventilators at the new Law Courts, Birmingham, were supplied by Mr. John Gibbs, of Liverpool. The ventilators were supplied by Messrs. John Gibbs, of Liverpool, and the ventilators so supplied were Messrs. John Gibbs & Son's "patent weatherproof extractors." The ventilators are stated to be a great success. Among the testimonials a well-known firm of architects write:—"We have much pleasure in stating that the eleven noiseless outlet ventilators you fixed at our senior partner's house, Parkbury, Oxton, have proved satisfactory. They have been subjected to severe tests during the past winter, and the vibration has been so slight as not to cause any inconvenience either in bed or sitting-rooms. We consider them a very great improvement on talc or mica flap ventilators."

Another firm write:—"We are pleased to inform you that the 'noiseless outlet ventilators' fitted up by you, both at our place of business and at the private house of our senior partner, are giving satisfaction, being effective as ventilators, and at the same time noiseless, as described by you."

ELECTRIC-LIGHT FITTINGS.



THOSE of our readers who are interested in electric-light fittings of artistic merit should pay a visit to the showrooms of Messrs. Perry & Co., of 17 Grafton Street, Bond Street, W. Aladdin's Palace itself could not have excelled the dazzling effect of the luxurious groups of candelabras, lamps, &c., which illumine by a touch of the magic switch. It is not merely in these charming fittings that the visitor would be interested—he would see

reproductions of the Renaissance period of Louis XIV., XV. and XVI., the result for the most part of Mr. Perry's personal travel amongst the leading Continental art centres. There are innumerable French and Italian examples from the Palace of Versailles, the Quirinal at Rome, St. Mark's Monastery, Florence, &c., every one of which furnishes a history that would delight the connoisseur. We illustrate some specimens, which will convey some idea of the design, the one below being a

Versailles lantern. The next sketch is an illustration of a candelabrum. Messrs. Perry & Co. can certainly boast of a royal list of patrons, extending from King George IV. down to royalty of the present day, who have called in Messrs. Perry's services in decorative matters. It is interesting to inspect the original designs for this class of work, which are carefully stored and highly valued. We should not omit to mention four large bronze candelabra. They are reproductions of the Renaissance, acquired by the deceased antiquary Baslini for

20,000 or 22,000 lire, and resold by him in Paris for 35,000, and subsequently for 70,000 frs. The modeller Pierrotti made faithful plaster casts of the original, and from these Messrs. Perry & Co. were commissioned to reproduce four exact copies, and have added to the upper part branches formed of winged boys supporting lamps. These candelabra stand 10 feet high, weigh nearly a quarter of a ton each, and have employed from fourteen to eighteen workmen and artists some thirty weeks. The chasing is excellent, the whole harmonious and rich, whilst the patina so delightful to the eye—that time alone gives—has by skilled artifice been produced on these magnificent bronzes.

YOKOHAMA HARBOUR WORKS.

AN account of the works for the improvement of the harbour of Yokohama, which have been undertaken by the Japanese Government, is contained in the last British Consular report from that place. The chief features of the works are two breakwaters, one on the north, the other on the east side of the harbour, training works for the river which discharges itself into the bay on the north-west side of the harbour, and a pier for sea-going vessels. The two breakwaters have a total length of 12,082 feet, of which about 7,730 feet are on firm bottom and 4,352 feet on deep and more or less soft mud. Where the bottom is firm the breakwaters are to be concrete, with a rubble hearting and a foundation of concrete bag-work. The whole of the latter has already been laid. For the parts carried on mud the substructure, up to 10·5 feet below low water of spring tides, will be a mound composed of tuff-rock in large pieces, the interstices of which are to be filled by finer pieces of tuff, with an addition of coarse sand. This mound, much of which has already been built, is to have a breadth at the top of 35 feet, with slopes of 1 in 2, which are to be pitched when settlement is at an end. Lines of piling, at a few feet distance from the toes of the slope, are designed to prevent lateral flow of the mud. On this foundation of tuff will be built a superstructure 18 feet high, formed of horizontal courses of concrete blocks, with a hearting of hard-packed rubble. The whole length of breakwaters will terminate at 1 foot above high-water level of spring tides, their purpose being to serve as breakwaters only. The breakwater heads will leave between them an entrance 800 feet wide, having a depth of 30 feet at low-water springs. Of the whole water-space, about 2·1 square miles, bounded by the breakwaters, the training works and the land, fully a square mile is available, in its present condition, as anchorage for vessels drawing from 15 feet to 29 feet. It is proposed to deepen the shallower parts by dredging, and also to extend it shorewards by the same process. The dredging operations have lately been begun with a large bucket-ladder dredger imported from the Clyde. The works will be partly close-piling, partly pitched mounds of tuff, carried up to high-water level. The pier is to be an iron structure, on screw piles, carried out 1,980 feet from the landing-place, and having,

at its inner end, a bridgeway of 50 feet span, to admit a long-shore passage for boats and launches. The outside thousand feet of the pier will have a depth on either side of from about 19 feet to 25 feet at low water, and a deck breadth of 62·5 feet, thus affording 2,000 feet of berthage for large sea-going vessels. Within this there will be 500 feet length, affording 1,000 feet of berthage for vessels drawing from 17 feet to 19 feet. Lines of railway will lead from the pier-head to the custom-house, and thence be extended to the railway station, there connecting with the main railway system of the country. It is anticipated that the works will be finished for all practical purposes in 1893.

THE LAW OF "COMMON EMPLOYMENT."

THE following is the conclusion of the report of the important case of Johnson (pauper) *v.* W. H. Lindsay & Co., which was heard in the House of Lords :—

Lord Watson, continuing, said :—The case was tried before Mr. Justice Grantham and a jury, who found for the plaintiff, and assessed damages at 52*l.* 10*s.* Their verdict was set aside, and judgment entered for the respondents by Mr. Baron Pollock and Mr. Justice Manisty, following what they conceived to be a principle established by the decision of the Court of Exchequer in Wiggett *v.* Fox (11 Ex. 832 and 25 L. J. Ex. 188). The learned Baron held it to be sufficient for the exoneration of the respondents that the appellants and their servants, though not necessarily fellow-servants, were fellow workmen in such a sense that the master of any one of them who negligently injured a fellow workman was not responsible for his negligent act; and he states the doctrine of Wiggett *v.* Fox to be that "if the person suing is the fellow labourer with the man whose immediate act occasions the injury, then there is no implied contract on the part of the master to recoup for any damage which he may suffer from that negligence." Mr. Justice Manisty was of opinion that the present case could not be distinguished from Wiggett *v.* Fox, and he added :—"If anything, in the present case the facts are stronger, in my view, to show that the persons employed upon this building were all under the control of the architect of the building owner." On appeal, Lords Justices Cotton and Lopes, Lord Justice Fry dissenting, affirmed the decision of the Divisional Court. Lord Justice Lopes, who delivered the judgment of the majority, states that, in their opinion, the respondents "became sub-contractors under Higgs & Hill, and were, together with the men directly employed by them, in the employment and under the general control of Higgs & Hill, working together for one common object, *i.e.* the carrying out of Higgs & Hill's contract, and taking upon themselves all the risks naturally incident to the work they had undertaken." That the learned judges meant to rest their decision upon that basis of fact is evidenced by their statement :—"We know of no case in which it has been held that a man is liable for an injury caused by his servant when the man doing the injury and the injured man are to be considered as employed in the work of another who is the common master of both." I do not think it necessary to discuss the question under what circumstances the servant of one man ought to be considered the servant of another. I can well conceive that the general servant of A might, by working towards a common end along with the servants of B, and submitting himself to the control and orders of B, become, *pro hâc vice*, B's servant, in such sense as not only to disable him from recovering from B for injuries sustained through the fault of B's proper servants, but to exclude the liability of A for injury occasioned by his fault to B's own workmen. In order to produce that result the circumstances must, in my opinion, be such as to show conclusively that the servant submitted himself to the control of another person than his proper master, and either expressly or impliedly consented to accept that other person as his master for the purposes of the common employment. To my mind there is not, in this case, a tittle of evidence to show that the respondents' workmen agreed to submit, or were in point of fact subjected, to the control either of Higgs & Co. or of Mr. Burden, the architect. I am, therefore, unable to assent to the assumption upon which the judgment of the Court of Appeal proceeds. I am also unable to assent to the legal doctrine which found favour with the Divisional Court and was pressed upon us in the argument for the respondents. I do not agree with Mr. Baron Pollock that the rule which exempts a master from liability to his servant for injuries negligently occasioned by a fellow-servant in the course of their common employment rests upon the absence of an implied contract by the master to recoup such damage. The master's responsibility for his servants' acts has its origin in the maxim, "Qui facit per alium facit per se," which has been construed as inferring his liability for what is negligently done by the servant acting within the scope of his employment. The immunity extended to a master in the case of injuries caused to each other by his servants whilst they are working for him to a common end is an exception from the general rule, and rests upon an implied undertaking by the servant to bear the risks arising from the

possible negligence of a fellow-servant, who has been selected with due care by his master. I am of opinion, with Lord Justice Fry, that, in order to raise the exemption, there must not only be common employment, but a common master; and that the respondents are liable, because, in this case, although there was common employment, there was no common master. The principle of the master's immunity in such cases, frequently termed the doctrine of *collaborateur*, is of comparatively recent origin. In the law of England it can hardly be traced further back than Priestley *v.* Fowler, which was decided in 1837 (3 M. and W. 1). It was rejected by the Courts of Scotland until 1856, when, for the first time in either country, it was fully explained and reduced to its proper limits by Lord Cranworth in the Scotch case of Bartonshill Coal Company *v.* Reid (3 Macq. 266). The doctrine had previously been formulated by the Supreme Court of Massachusetts, in a judgment delivered by Shaw, C.J., in Farwell *v.* Boston and Worcester Corporation (4 Metcalf, 49), which was referred to with approval by Lord Cranworth. It is needless to quote passages from the opinions of Lord Cranworth and Shaw, C.J., which are now so familiar to professional lawyers. It is sufficient to say that, in my opinion, the rule, as laid down by these eminent judges, is strictly confined to the case of common employment under a common master, and that the reasons which they assign for the introduction of the rule have no application to any other case. Counsel for the respondents relied upon three decisions, two of them Scotch, as authorities for the extension of the doctrine to cases where there is no common master, but common employment for a common object. The first of these cases is Wiggett *v.* Fox (Ex. 832), as to which I can only say that, if it must be taken to establish the proposition maintained by the respondents, I could have no hesitation in holding that it was not decided according to law. But Baron Channell subsequently explained that he assented to the judgment because he thought Fox & Co. had control over Wiggett; by which he probably meant that the relation of servant and master did actually exist between Wiggett and Fox & Co. If that be taken as the true ground of the decision, it does not support the argument of the respondents, but comes within the rule enunciated by Lord Cranworth. The next case is Woodhead *v.* The Gartness Mineral Co. (4 Sess. Ca. 4th Series, 469), which was decided in 1877 by a majority of seven to one of the Inner House Judges of the Court of Session, the late Lord Justice Clerk (Lord Moncrieff) being the sole dissentient. It does not appear to me that the decision goes the full length of affirming that in cases of common employment, under different masters, each master is freed from responsibility for injuries inflicted upon the workmen of other masters by the negligence of his servants. The Lord President (Inglis), whose views are in substantial agreement with those of the six learned judges who came to the same conclusion with him, said:—"If two miners are employed and paid by the same master, and while they are hewing at the working face the one, by negligence, injures the other, the master is not answerable, because it is said they are engaged in a common employment—that is to say, they are engaged in the same work as servants of the same master. But if the legal principle were applicable to this case only it would cease to be a principle, and degenerate into a mere artificial and arbitrary rule. It is not because the wrongdoer is in a technical sense the servant of the same master that the master is not answerable. It is of no moment to the injured workman whether his injury be caused by a servant of the same master or by one who has undertaken some function in the same mine upon what is called an independent contract. The injury in either case is the same. The personal liability of the wrongdoer is the same. But the mine-owner is free from responsibility, not because the injured and the injurer are both his own hired and paid servants, but because he is not personally in fault, and has not warranted the injured workman against the perils of the work." In the third case relied on by the respondents, namely, Maguire *v.* Russell (12 Sess. Ca. 4th Series, 1,071), one tradesman had contracted to execute plumberwork and another to lay asphalte pavement in the same building; they proceeded to work under independent contracts, and in the course of their operations a workman engaged in asphalting was injured by a hammer which fell through a skylight in the roof through the negligence of one of the plumber's servants, and the injured man brought an action of damages against the plumber. It was not alleged in defence that the two men were working under the same master; but the second division of the Court assoilzied the defender, on the ground that the case was not distinguishable from Woodhead *v.* The Gartness Mineral Co. Notwithstanding the eminence of the judges constituting the majority of the Court in Woodhead *v.* The Gartness Mineral Co., I am constrained to differ from the law which they laid down. It appears to me to carry the immunity of masters far beyond the very precise limits assigned to it by the decisions of this House; and I have, therefore, no hesitation in affirming that it is not the law of Eng-

land. I think it right to say that, in my opinion, certain observations made by the Lord Chancellor (Cairns) in the Scotch case of Wilson *v.* Merry & Cunninghame (1 Sc. and Divce. 326) were construed by some, if not all, of the majority in Woodhead *v.* The Gartness Mineral Co. in a sense which the noble and learned lord never intended them to bear. But, in order to appreciate the real purport and effect of these observations, it is necessary to advert to the previous course of judicial decisions in Scotland upon the question of a master's liability, and to the single point which the House had to determine in Wilson *v.* Merry & Cunninghame. Down to the date of the judgment of this House in the Bartonshill cases, the Court of Session declined to accept the doctrine of *collaborateur* as part of the law of Scotland, and held the liability of a master for his servants' fault to be the same in the case of a fellow-servant as of a stranger. After the doctrine was authoritatively declared to be Scotch law, the Court of Session construed the word *collaborateur* in its strictest sense, as signifying a fellow-servant who laboured with his hands. In pursuance of that technical interpretation, it was held in Somerville *v.* Gray (1 Sess. Ca. 3rd Series, 768) that a manager or foreman who merely superintended, and did no manual work, was not a *collaborateur* within the meaning of the rule, and consequently that the common master was responsible for injury to a fellow-servant arising from his negligence; whereas in Wright *v.* Roxburgh (2 Sess. Ca. 3rd Series, 748) it was decided that the manager of a colliery who with his own hands broke down part of a ventilating apparatus, and thereby caused an explosion of fire-damp which injured a workman in the service of his master, was acting as a *collaborateur*, and that the master was free of liability. Wilson *v.* Merry & Cunninghame was, in its circumstances, on all fours with Somerville *v.* Gray, and the Court of Session, therefore, came to the same conclusion that the master was not liable.

In moving the reversal of the judgment, the Lord Chancellor (Cairns), after citing the opinion of Lord Cranworth in Bartonshill Coal Company *v.* Reid, went on to say:—"I can only add to this statement of law that I do not think the liability or non-liability of the master to his workmen can depend upon the question whether the author of the accident is not, or is, in any technical sense the fellow-worker or *collaborateur* of the sufferer. In the majority of cases in which accidents have occurred the negligence has, no doubt, been the negligence of a fellow-workman; but the case of a fellow-workman appears to me to be an example of the rule, and not the rule itself" (1 Sc. and Divce. 331–32). That language appears to have been regarded by the Court of Session as justifying the inference that the rule ought not to be confined to fellow-servants of the same master—a construction which ignores the fact that the noble and learned lord was professedly speaking of the "liability or non-liability of the master to his workmen," and was dealing with no other subject. I do not doubt that the language of the noble and learned lord was simply intended to express his opinion that to hold a fellow-servant who directed, but did not labour in the common employment, was not a *collaborateur* was a strained and technical interpretation of the rule. I concur in the compendious definition of the principle upon which the master's non-liability rests which was given by my noble and learned friend Lord (then Mr. Justice) Blackburn, in Howell *v.* Landore Steel Company (L. R. 10, Q. B. 64), six years after the decision of this House in Wilson *v.* Merry & Cunninghame. His lordship said in that case:—"It is a rule of law that the master who employs a servant (not an agent) is responsible for the negligence of that servant in matters in which he is employed; but there is this exception, which has been established by a series of decisions, that with regard to a fellow-servant the master is not held so responsible, because this negligence is to be taken as one of the ordinary risks which the servant contemplates and undertakes when entering into his employment." For these reasons I concur in the judgment which has been proposed by my noble and learned friend on the woolsack.

Lord Morris concurred.

The judgment of the Court of Appeal was reversed and the judgment for the appellant was restored, the respondents to pay the costs in the Courts below and the costs incurred in the appeal to the House of Lords, the latter costs to be taxed in the manner usual where the appellant sues *in formâ pauperis*.

THE MIDGET ARC LAMP.

THE great economy of arc as compared with incandescent lighting renders interesting any attempt to popularise the use of small arc lamps. For large shops or small lecture theatres, something between the usual large arc and the ordinary incandescent lamp has long been wanted. It is absolutely necessary not only that these small lamps should possess perfect steadiness, but also that they should be so simple in construction that they may be relied on for keeping in working order without con-

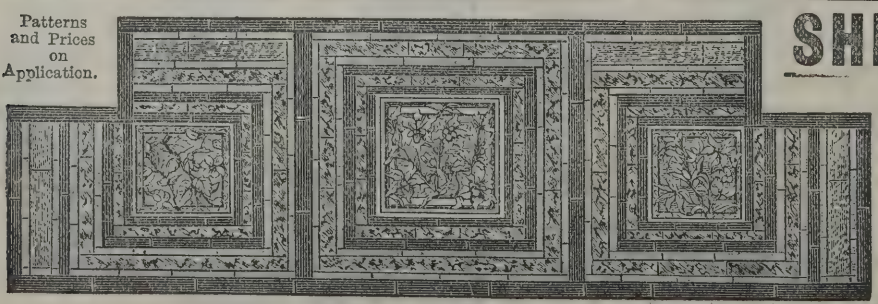
stant skilled attention. It is a lamp which fulfils these conditions, and which we confidently recommend for general use, that we purpose noticing now. It is called the "Midget" from its small size, and is made to give 250 candle-power, using five ampères at an electromotive force of 45 volts, so that even with this small size of lamp we obtain one candle-power of light for the expenditure of every "watt" of electrical energy used. The illustration shows the general appearance of the lamp. The smallness of the globe prevents any depth of shadow, and minimises any complaint which may be urged against the inequality of the distribution of the light. The principle upon which the lamp works may almost be called simplicity itself. The upper parts of the rods forming the frame of the lamp are hollow, and in these the lower portions slide quite easily. The bottom carbon is attached to the lower part of the frame, which is fastened to the upper portions of the lamp by a chain passing up the hollow pillar forming the upper portion of the lamp, round a pulley-wheel, whose motion is controlled by clockwork, and then to the upper carbon holder, which acts as a counterpoise, and slides freely between the hollow pillars forming the frame of the lamp. The motion of the pulley is controlled by clockwork, which is started and stopped by a pivotted bar on whose under surface a number of teeth are situated. These engage a pointer attached to the pendulum of the clock. This bar is pivotted in the centre and attached at each end to iron plungers, which move inside the cores of electromagnets actuated respectively by the main and shunt circuits. When, owing to the distance between the carbon points, the resistance of the main circuit increases, and consequently the current through the shunt increases, the plunger is drawn further into the core round which the shunt circuit passes and the pendulum is released, the clockwork moves the carbons nearer together until the main circuit increases so much as to draw the other plunger into the core round which it passes, and so overpowers the effect of the shunt circuit. The bar is drawn down, the teeth engage the pendulum of the clockwork, and the carbons are maintained apart until, owing to the burning away, the same action is repeated. This action is so delicate that no inconvenience at all is caused by the intermittent feed; indeed it is scarcely noticed. When the current is stopped the pendulum is released owing to the action of a spring upon the bar, and the clockwork causes the carbons to remain together. In the small box over the upper carbon-holder the current before passing to the carbon magnetises an iron core, and lifts the upper carbon a small distance above the lower one, thus forming the arc when the current is first put on the lamp. The carbon is held up in this manner all the time the current is passing through the lamp. The lamp is wound in three different ways—one suitable for parallel working, one for series, and one for use with alternating currents. Those which are at present in use have given great satisfaction, and to meet the growing demand Messrs. Woodhouse & Rawson United, Limited, of 88 Queen Victoria Street, London, have stocked a large quantity of them, from which they will be able to supply orders.



REGISTRATION OF PLUMBERS.

THE results of the May examinations of the students of the Glasgow and Greenock plumbers' classes in connection with the Glasgow and West of Scotland Technical College have just come to hand, and they are eminently satisfactory to the students and to the lecturer, Mr. David Fulton. The number of matriculated students in both classes last session was 130. About 80 of them took the technical examination, which lasted three hours, and of this number there have been 45 passes—11 in honours and 34 in the ordinary grade. Out of 20 of the students who went in for the practical examination—four hours' work—there have been 19 passes. In the honours grade there are two prizes for the United Kingdom. The first is 3*l.* in money, with a silver medal, and it has been gained by a student of the Greenock class, William M'Alpine. This student last year took the second prize in the ordinary grade. In the ordinary grade there are five prizes for the United Kingdom, and the third, 1*l.* in money, with a bronze medal, has been gained by a Glasgow student, Robert Young. Thus two of the seven prizes (and one of these the very highest) applicable to the United Kingdom have come to this district. These good results should stir the benevolence of the master plumbers to

have the education of the young plumber even more complete, and they may be reminded that there is no practical plumbers' workshop in connection with the college.

The second annual congress of delegates from the several Scottish district councils for the national registration of plumbers was held at Glasgow on the 29th and 30th ult., under the chairmanship of ex-Bailie Crawford, chairman of the health committee of the city. About fifty delegates attended, including sanitary and other representatives and the Clerk and Master of the Worshipful Company of Plumbers. The Chairman, after welcoming the delegates to Glasgow, said that he could claim, as representing the authorities of Glasgow, that they were quite aware of the necessity for sanitary reform, and that this registration movement was very welcome indeed. Any encouragement that could be given to this movement on behalf of the authorities in Glasgow might be relied upon. In the name of this congress and the plumbers throughout Scotland he should take the opportunity of expressing their warm appreciation and hearty admiration of the efforts being made by the Worshipful Company of Plumbers in the direction of sanitary reform. The secretaries of the various councils reported as to the present state of technical and practical education for young plumbers in their respective districts. These reports, on the whole, were satisfactory. A proposed graded scheme of education applicable to the whole of the districts was described by the clerk to the Plumbers' Company, and Mr. Fulton, lecturer to the Glasgow and Greenock plumbers' classes, having by invitation given his opinion, it was unanimously resolved, after considerable discussion, "That this congress, having carefully considered the graded syllabus of education and examination prepared by the Worshipful Company of Plumbers, recognises that it is fitted to greatly advance the members of the craft, and earnestly recommends the various councils to endeavour to have the provisions of the scheme adopted in the various technical institutes throughout the country." The subject of the promotion of new classes in the larger centres in direct connection with each council was remitted to the councils, as was also the question as to the ways and means for best promoting workshop instruction in connection with the technical classes. The apprenticeship question was before the congress in connection with a proposed model indenture, and it was resolved that this matter should also be remitted to the councils for their opinion. With regard to technical libraries, the congress was of opinion that such libraries would be beneficial, and that they should be instituted. Matters in connection with the section of the International Congress of Hygiene in London dealing with the education and registration of plumbers and the draft of the proposed parliamentary Bill for conferring corporate powers in connection with the national registration of plumbers were also considered.

PATENTS.

BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards Portable Filters on this System, £1 5s. to £3.

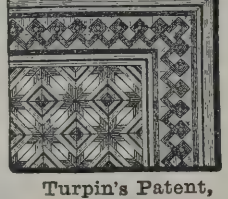
BUILDING AND BUILDERS.

THE half-yearly meeting of the National Association of Master Builders of Great Britain has been held at Cambridge, under the presidency of Mr. J. C. White, of Liverpool. Representatives were present from London, Liverpool, Manchester, Birmingham, Bradford, Cambridge, Bolton, Leicester, the Potteries and Preston. The report and accounts for the past half-year were passed and adopted. The questions submitted by the Labour Commission were discussed and also the question of a form of contract, which is under consideration by the Royal Institute of British Architects. It was also referred to the Council to consider the advisability of establishing in the building trades some system of national federation of employers and employed, somewhat on the lines of similar recent associations, and also dealing with the pensioning of old and disabled workmen.

THE work of remodelling and renovating Forthampton Court, near Tewkesbury, for Mr. Reginald Yorke, which Mr. Albert Estcourt, contractor, of Gloucester, has had in hand for the past eighteen months, has now been completed, and the chief architectural features of the old mansion have been well preserved.



THE Cardiff County Council have under consideration a scheme for borrowing 34,000*l.*, for the purpose of acquiring new building and lands for technical instruction purposes in the district.

THE *Aberdeen Free Press* says that at the Town Council meeting it was stated in the course of the discussion on the Union Terrace improvement that a public body in Aberdeen

were negotiating for ground in Union Terrace on which to erect new buildings. It is understood that the body referred to is the School Buildings Committee of the School Board, who have been looking at a site in Union Terrace on which to build new offices for the Board.

THE Grand Theatre and Opera House at Stockton has been entirely remodelled by Mr. Frank Matcham, architect, whose plans have been carried out under the direction of Mr. C. Moses, of North Ormesby.

THE Governors of the Pontefract Grammar School have unanimously resolved to erect and furnish a chemical laboratory in connection with the school at a cost of about 300*l.*

VARIETIES.

THE Lincoln Town Council, as urban authority, propose obtaining compulsory powers to acquire the properties between High Street and Hungate required for the completion of West Parade.

IT is proposed to construct a bridge over the river Wear at Chester-le-Street, in order to open out more direct and convenient communication between the important communities living on each side of the river.

IN recording the death of Mr. Isaac Booth, architect and surveyor, at Halifax, in his sixty-eighth year, the *Halifax Courier* says:—Mr. Booth was a native of Keighley, and was articled with the late Mr. Dennis Chantrell, of Leeds, and while serving under his articles he acted as one of the clerks of works of the Leeds parish church. On completing his term with Mr. Chantrell he was engaged for some time in the ordnance survey of Yorkshire. Afterwards he commenced business on his own account in Keighley, and superintended the erection of the parish church there. About forty years ago he came to Halifax, entering into partnership with Mr. Richard Carter, their offices being in Horton Street, where Messrs. Bracken's warehouse now is. A few years later Mr. Carter left Halifax, and since that time up to his death Mr. Booth carried on business on his own account in the offices in George Street. Latterly he was much more engaged in surveying and engineering works than in architecture, and there were few arbitrations in the district affecting real property where he was not in some way concerned, either as umpire, arbitrator or witness. The last public scheme of importance in which he has been concerned is that for constructing a railway through Booth Dean to Lancashire. He had made a survey of the route, and was consulting engineer to the promoters.

AN inquiry has been held at Skipton into the application of the Skipton Local Board to borrow 2,300*l.* for public improvements in the town. The inspector expressed himself satisfied with the proposed improvements.

THE Birkdale Local Board propose to obtain powers to borrow 15,900*l.* for drainage purposes and about 3,000*l.* for street improvement works.

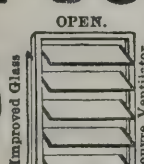
THE 1,008th anniversary of the parish church, Chester-le-Street, has just been celebrated. The history of the church dates from 883, when the monks of Lindisfarne brought the body of the sainted Cuthbert to Chester-le-Street.

LIGHTNING conductors have been fixed to the four pinnacles of Gloucester Cathedral tower. No mishap happened, although the men have been exposed to extra risk when at work on the tower during the heavy thunderstorms which have recently occurred. The fixing of conductors to the dozen other pinnacles of the cathedral, which have an altitude considerably less than those of the tower, will next be taken in hand.

AT the meeting of the Stratton Rural Sanitary Authority it was decided to commission Mr. Anson to prepare plans and specifications for water supply works for Stratton and Bude.

A COMMITTEE meeting of the Works Committee of the River Dee Board of Conservators, together with representatives of the Cheshire and Flintshire County Councils, has been held at Chester to consider the proposal for erecting a new bridge over the Dee at Queen's Ferry to take the place of the ferry-boat service. The committe of Conservators are to prepare a scheme for submission to the two County Councils.

A RESOLUTION proposing the building of new police stations, &c., at Millom and Cockermouth, and the acquirement of the sites, has been agreed to by the Carlisle County Council.



THE *Liverpool Courier* says:—No award has yet been made by the arbitrator in the Monk and Newell litigation, but the Water Committee yesterday (the 11th inst.) had their eyes opened with regard to the enormous costs that were incurred in connection with the arbitration, more especially for fees. The

"little bill" was simply mentioned, and when some of the members became aware of the large amount due from the Corporation on this account they did not hesitate to express their astonishment and indignation. What the actual amount is has not transpired, but the ratepayers will ere long know precisely how the matter stands, for at the next meeting of the committee it will in all probability be fully discussed.

The popular prices at the Olympic Theatre, now known as "the people's theatre of London," have hit the public taste, and crowded houses nightly have proved the wisdom of Mr. W. W. Kelly's bid for the favour of the masses. In consequence of the great success of its revival at a West-End theatre, "Theodora" will be played until the end of the present month, and on and after Saturday next will be preceded by a new farce written by Mr. Murray Carson, entitled "Two in the Bush."

It has been decided to borrow 15,700*l.* for the purposes of reconstruction of sewers in Paisley.

Improvements are to be carried out at Leicester Town Hall at an estimated cost of about 1,700*l.*, which includes reseating the council chamber.

A scheme for the sewage disposal is under consideration for Blackburn, the cost of which, it is thought, will amount to nearly 100,000*l.*

The Executive Committee of the Association for the Promotion of Art and Music in Glasgow have resolved that there should be a double competition with the view of obtaining a suitable design for the new galleries. From among the competitors at least five will be selected, and they will be invited to send in complete plans and drawings, one of which would be selected. Mr. Alfred Waterhouse, R.A., was appointed assessor to guide the committee in the various steps they have to take in framing instructions for the competition, and in finally selecting a plan. It was also remitted to Mr. Waterhouse, along with Mr. Macdonald, city engineer, and Mr. Paton, curator of the Corporation Galleries, to adjust, on the basis of the report approved, the conditions of the competition and the instructions to the architects. These will be printed and submitted to a meeting of the executive to be held on Monday, August 24, so that advertisements can appear in the architectural and other technical journals on August 29 inviting competitive plans, which it will be arranged should be sent in early in November. It is expected that building operations will be commenced in April next, and that the foundation-stone will be laid in August next.

TRADE NOTES.

The new schools, Ince, near Wigan, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

The difficulty of securing gas-light in out-of-the-way country houses, factories, &c., is met by the "Helios" gas-making machine, at a cost of less than 1*s.* per 1,000 cubic feet. The "Helios" is simple, automatic, and the element of danger is entirely absent. The Incandescent Gaslight Company, Limited, 14 Palmer Street, Westminster, S.W., are the proprietors of this invention. We hope to give illustrations of the "Helios" in our next issue, and enter more in detail as to its merits.

On Bank Holiday last an interesting event took place at the parish church, Epworth, viz. the starting of a new public clock, striking the Cambridge chimes on four bells and the hours on a fine tenor bell of about 27 cwt. The old clock, which was quite worn out and useless as a timekeeper, was erected just a century ago to commemorate the event of some of the family being preserved from a fire at the rectory. The present clock was erected by public subscription, Mr. Thos. Johnson acting as secretary to a strong committee. Messrs. Wm. Potts & Sons, clock manufacturers, of Guildford Street and Cookridge Street, Leeds, makers of the cathedral clock, Lincoln, were selected to carry out the necessary work, which they have done to the satisfaction of all concerned.

On the 31st ult. a new clock was dedicated in the parish church, Arksey, presented by the Misses Dunhill in memory of their father. The hours are struck on the tenor bell, which bears the date 1622, and the quarter chimes on two smaller bells placed in the tower fifty years after that date. The design is that of Lord Grimthorpe, with the gravity escapement attached, and compensation pendulum and maintaining powers. The clock has a solid horizontal cast-iron bed frame (which is fixed on strong cast-iron brackets bolted to the wall of the tower) and has all the latest improvements. The work has been done by Messrs. Potts & Sons, of Leeds.

The directors of the Crystal Palace Company, in deference to the wish of the electrical trade section of the London Chamber of Commerce, have decided to postpone the opening of the Electrical Exhibition from November 1891, till January 1, 1892, on which date the exhibition will be formally opened. We understand that the Chamber of Commerce proposed a

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

further postponement, but the directors, anxious as they were to meet their views, could not agree to a later date than January 1 without breaking faith with a large number of exhibitors who have applied for space, and who are now preparing their exhibits. It will be gratifying to intending exhibitors to learn that, with the view of promoting the success of the exhibition, the Chamber of Commerce have agreed to appoint a committee to act with the directors of the Crystal Palace Company.

The Worcester City Council have agreed that permission should be obtained from the Local Government Board to borrow 1,800*l.* to put in stopcocks to prevent the waste of public water.

At a meeting of the shareholders of the Liverpool Overhead Railway the chairman announced that good progress was made with the construction of the line, which is to extend along the Liverpool docks for a distance of seven miles, and that the directors had decided to adopt electricity for propulsion, and had made a contract for the supply of motive power, and also for running the trams at a fixed charge for the next two years.

The work of reflooring Manchester Cathedral is to be taken in hand at an early date.

The Electric Lighting Sub-committee of the York Corporation have been instructed to visit places where the high and low tension of lighting is in use, and report.

The tender of Mr. J. R. Maw, of Hull, has been accepted by the Pontefract Rural Sanitary Authority for the execution of the waterworks scheme designed by Mr. Malcolm Paterson, C.E., of Bradford. The total cost of the scheme will be about 1,200*l.*

The position of the London wood market for July has, Messrs. Churchill & Sim state, been peculiar. While the prices obtainable for wood of almost every kind free on board at the foreign and colonial shipping ports have been advancing, and the markets at the chief English outports and Continental centres have been responding to this advance, rates in London, in spite of a very light importation and a fair demand, have rather receded than otherwise. This is difficult to account for; and it seems probable that when dealers return from their holidays, especially if a settlement of the labour disputes in the building trade can be effected in the meantime, a reaction must set in, the very unattractiveness of the London market furnishing a guarantee against the upsetting of the present healthy condition of affairs by an excessive importation.

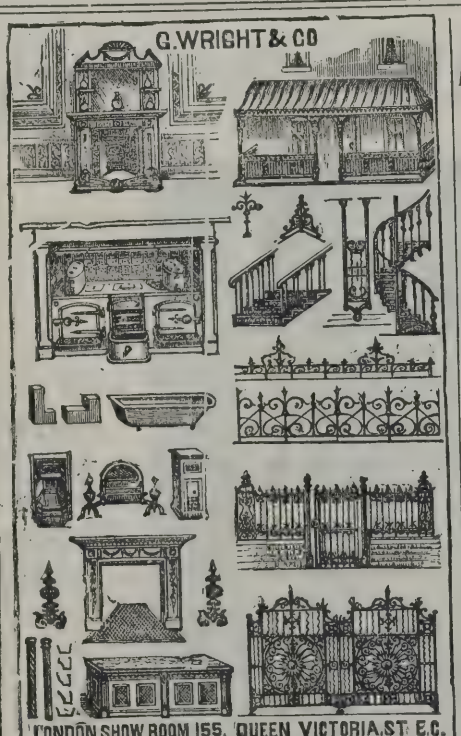
The managing director of the Electric Construction Corporation, Limited, Mr. Ebbsmith, has resigned his official position, and has been elected to the seat on the Board vacated by the decease of Sir R. N. Fowler, Bart. Mr. Thomas Parker, the present works director, will in future act as general manager of the Corporation.

Tenders have been accepted by the Ribble Navigation Committee as follows:—For pair of horizontal pumping engines, hydraulic high-pressure and return water mains and valves, and machinery, penstocks, sluices, &c., Tannett, Walker & Co., 7,463*l.* 14*s.* 6*d.* Steel rails, chains, switches, crossings for railway sidings, crossings, points, &c., T. Summerson & Sons, 3,745*l.* Erection of engine and boiler-house, accumulator-house, chimney, &c., J. Christian, 2,650*l.* Roadmaking, Executors of T. A. Walker, 1,250*l.* Boilers and pumps and a Green's economiser, J. Foster & Sons, 1,130*l.* Laying the above-mentioned railway sidings, &c., Executors of T. A. Walker, 755*l.* Water-pipes, castings, hydrants, for gas and water supply, Allsup & Sons, 731*l.* 18*s.*

A series of five 3-inch "Abyssinian" tube wells have recently been put down in a field adjoining the Tuckton pumping station of the Bournemouth Gas and Water Co., by Messrs. Le Grand & Sutcliff, of London. A pumping trial test has been made for seven days, working continuously day and night, which has given very satisfactory results, as a uniform yield of over half a million gallons per day was obtained, which only temporarily lowered the head of water 7 feet.

Tenders have been invited for the enlargement of the two reception-rooms of the Devon County Lunatic Asylum, a grant of 600*l.* having been promised by the County Council.

The tender of Messrs. Kenyon & Moulding, of Blackburn has been accepted for altering and extending fire-engine station, Clayton Street, Blackburn.



We lately mentioned the proposed sale of building land in plots at Hastings, on the St. Helens Park Estate. Messrs. E. & H. Lumley, auctioneers, of 22 St. James's Street, London, have since effected a highly successful sale. The estate, which comprises about 100 acres, was purchased some years ago by four gentlemen of Hastings, who have allowed the land to remain without much effort to realise it until now. Mr. Humphreys, architect, of Hastings, in conjunction with Messrs. Lumley, designed a plan of roads and plottings suitable to the conditions and formation of the ground. The result has been a singularly convenient scheme of frontages and well-planned

roads, with a site for a church, a piece of ornamental water and a tan gallop of about a mile and a half. Before the sale commenced a lunch was given by the proprietors to the assembled company at the St. Helens Hotel. Mr. Henry Lumley afterwards proceeded with the real business of the day. Among the buyers, by themselves or their agents, were Messrs. Atkinson, M.P., Box, Jackson, Cheyney, Marshall, Hickman, Townsend, Hayes, Murray, Eldridge and Cousens. Some of the finest lots realised high prices, the general average being from 400*l.* to 600*l.* an acre, and it is expected that as the sales proceed—for it is intended to hold another sale soon, to be followed by similar proceedings at fixed periods—these prices will be doubled, for it is obvious that as sales continue to be made so the value of the remaining plots must increase.

THE expenditure of 1,700*l.* on the Kilkenny District Lunatic Asylum, 1,000*l.* on the Mullingar District Lunatic Asylum, 2,550*l.* on the Killarney District Lunatic Asylum, and 800*l.* on the Richmond District Lunatic Asylum, has just been authorised.

TENDERS have been accepted for the erection of a new chapel on the site of the present building belonging to the United Methodist Free Church at Littletown, Liversedge. The tenders amount in the aggregate to 1,800*l.*

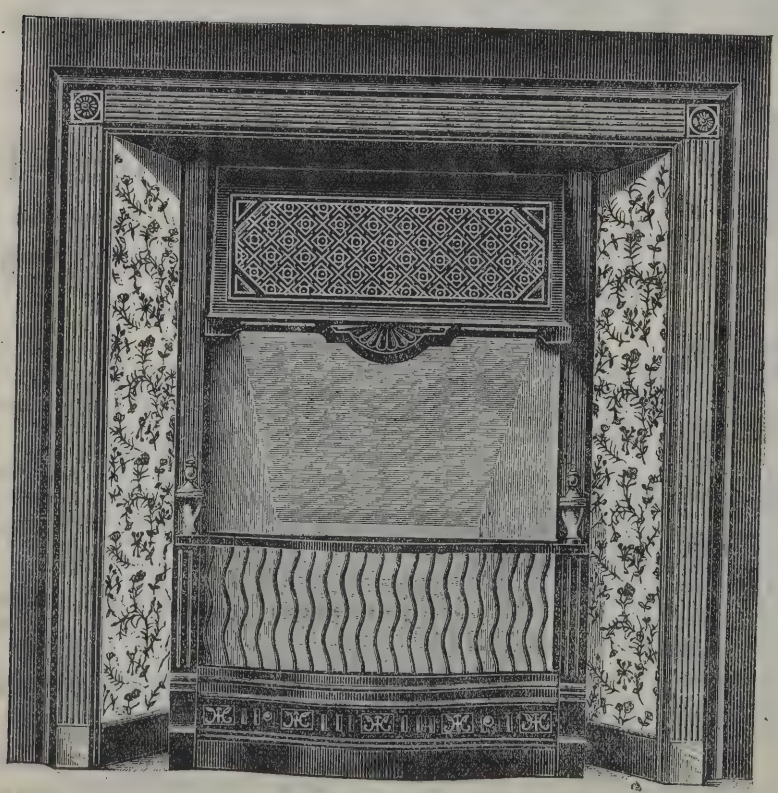
AMERICAN NOTES.

PLANS have been prepared by Mr. A. P. Boller, architect, New York, for the new Seventh Avenue bridge across the Haarlem River. The structure is to be 67 feet wide, and is to have one of the largest draws in the world. It will cost at least 1,250,000 dols. The plans were referred to the Comptroller.

THE Exhibition directors have leased for three years a right of way that will enable every railroad in Chicago to enter the grounds. The right of way is a strip 50 feet wide, running in an irregular course from the entrance at Sixty-seventh Street to the Baltimore and Ohio tracks at Seventy-first Street, where that road leaves the Illinois Central. Four tracks will be built to make connections with the Baltimore and Ohio.

ACCORDING to the *Gloucester Chronicle*, it is stated that the Mayor and Council of Gloucester, Massachusetts, have decided to invite the Mayor and Corporation of Gloucester, England, to attend the 250th celebration of the formation of that city next year.

NOTES ON NOVELTIES.



Ventilators.—That the English systems of ventilation and sanitation are universally approved is seen by the large share of the work which is entrusted to English firms of acknowledged ability. Amongst the latest of these contracts is one for the ventilation of large cotton and jute mills in India, given Mr. Arthur W. Stephenson, the engineer to the "Climax" Ventilating Company, of 15 Great George Street, Westminster. The exhaustion of the foul air is effected by a number of their direct-acting turret ventilators fixed along each roof, provision being made for the admission of a large volume of fresh air, which can be regulated by an ingenious arrangement, or its temperature reduced to any extent, according to will. The company are also carrying out the ventilation of an art gallery in New York, neither trouble or expense being spared. The external ventilators are specially designed to harmonise with the architectural features of the building, and the internal fittings of a most elaborate kind work in with the interior decoration. The "Climax" Company are carrying out the ventilation of large powder mills in Kent, and of a new church in Essex. The former is the first time a work of the kind has been undertaken, it being required to reduce the temperature from 108 deg. to 60 deg. The latter consists of a "Climax" direct-acting ventilator as a feature on the roof at intersection of chancel and nave. This ventilator when completed will be one of the highest, if not absolutely the highest in the kingdom, height from ridge of roof to top of finial being over 45 feet. The firm already hold gratifying testimonials.

ARTISANS' DWELLINGS IN DUBLIN.

AT the meeting of the Dublin Corporation the following report was submitted from Sir Charles Cameron, superintendent medical officer of health, in reference to the erection of artisans' dwellings at Blackhall Street :—

"You have asked me to report upon a scheme for converting a number of houses belonging to the Corporation into tenements, and also for the erection of two-storey dwellings for the working-classes. I have examined the plans for the proposed scheme, and have inspected the houses proposed to be converted into tenements. With respect to these houses I regret the proposal to adapt them as residences for artisans, and for the following reasons :—1. I am opposed to the providing by

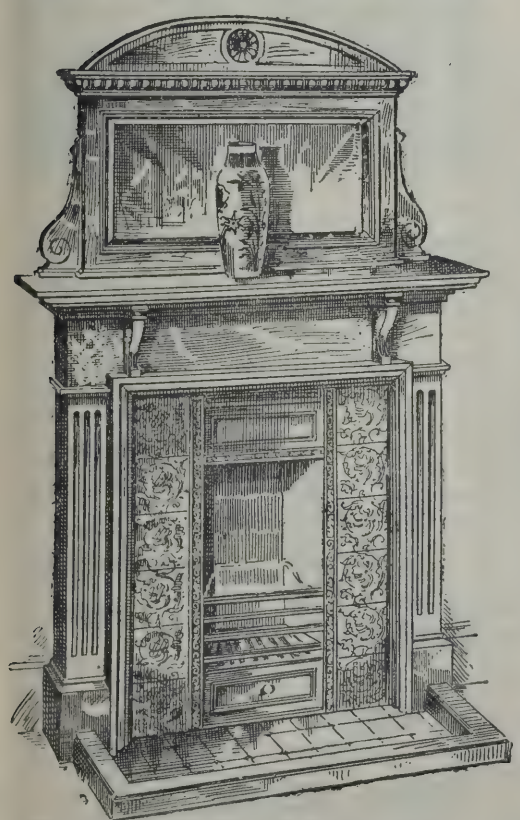
PATENT No. 2496. A.D. 1884.

local authorities of dwellings which let at rents exceeding 3*s.* 6*d.* per week. It would be better to allow building societies and private persons to provide dwellings for the respectable working-classes who can afford to pay higher rents. In my opinion the only excuse for the erection of dwellings by a municipal Corporation is that such a procedure tends to promote the public health. The germs of the infectious diseases find an abiding-place and a hotbed in the homes of the poorest and most squalid classes. There are few persons willing and able to provide improved accommodation for the lowest classes, because the rents which the poorest people can afford to pay would not give a sufficient return for money invested in providing dwellings for them. These poor people are now lodged in dilapidated old houses and converted stables, and their landlords generally are middlemen, who rent the houses and sublet them to the tenants. These middlemen do nothing to improve the wretched tenements which they farm, and even if they were willing to do so, they have no means for carrying their desires into effect. Hundreds of the tenement-houses inhabited by the labouring classes have been detenanted and closed through the efforts of the Public Health Committee and their staff; but there are still thousands of people living under very insanitary conditions, and for whom it would be most desirable to provide improved dwellings. The money which Lord Iveagh has given for providing dwellings for the working classes will, I believe, be expended in building tenements which will be let at not more than two shillings per week. This money will, therefore, do real service, for it will help the classes who most need assistance. The Corporation tenements in Bow Lane are also of the class most required, as they are let at rents varying from 2*s.* to 3*s.* 6*d.* per week. It would be desirable even to have tenements at 1*s.* and 1*s.* 6*d.* for the very poorest people, whose homes are usually indescribably wretched and insanitary. Every tenement which a local authority provides at a weekly rent less than 3*s.* 6*d.* replaces an unhealthy dwelling; but every tenement at a higher rate would not necessarily replace an insanitary dwelling. 2. I think the Corporation houses in Blackhall Street ought to be repaired and let as dwellings, each for one family. I am pretty sure that they would all soon be let if they were made attractive. The street is a very fine one, and being near the new barracks at Grangegorman they might be let furnished or unfurnished to officers by the persons to whom the Corporation would lease them. The houses on the opposite side of the street, which are the property of the King's Hospital, and which are now in tenements, will probably be repaired and let as dwellings for single families. The fact is that the houses in this street would probably have remained houses for single families had they not got into the hands of house-jobbers, who converted most of them into tenements, so that they might get a bigger profit out of them. The result now is that the tenement houses have been literally wrecked, whilst those that still remain private houses are in excellent condition. 3. With respect to the plans for converting Blackhall Street houses into tenements, I beg to remark that the proposal to form the basements into dwellings is against the letter and spirit of the Public Health Act, 1878; and it would not be to the credit of a sanitary authority to break itself the laws which it administers in the case of others. No sanitarian could approve of families being altogether located in underground dwellings into which the rays of the sun never penetrate. In conclusion, I would take leave to recommend that any dwellings which may be erected by the Corporation in this or any other locality shall be let at rents not exceeding 3*s.* 6*d.* per week."



Mr. Spencer Harty, borough surveyor, reported as follows:—"As you are already aware, these houses were originally built for the occupation of one family; they are four storeys over the basement, and are extremely airy and good buildings for the purposes proposed. The ground floors are composed of two rooms varying in size, the one from 14 feet 3 inches by 17 feet 6 inches to 15 feet 6 inches by 18 feet 5 inches, and 15 feet 10 inches by 16 feet, the other from 19 feet by 13 feet 9 inches to 21 feet by 14 feet, with a good open hall and staircase, and rooms and hall well lighted; the remaining floors are all similarly good, that on the third floor being very good, and is divided into three apartments. The height of the ground floor from basement to ceiling is 10 feet, that of the first floor 11 feet 6 inches, second floor 10 feet 6 inches, and third floor 8 feet; indeed there are very few houses in Dublin in which the cubical capacity of the rooms is so large. The design of the dwellings is so arranged that each tenement will have a separate w.c., scullery and pantry to itself, and on a separate landing, and perfectly isolated from the other tenements. It would be well for the public health if all tenement houses were similarly arranged. With regard to the basement, Sir Charles Cameron takes exception to them as not complying with the 83rd section of the Public Health Act. This section, with the preceding one, says it shall not be lawful to let or occupy as a separate dwelling underground rooms unless the following provisions are complied with:—Unless the cellar is 7 feet high. The cellars in basement of these houses are 9 feet high.

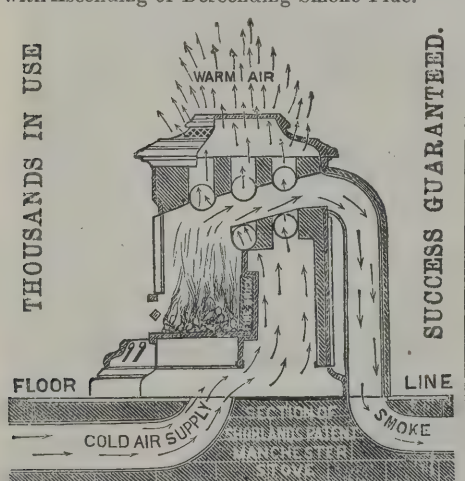
Size of Opening, 38 in. by 38 in. £15 10s.

Unless the ceiling of the cellar is 3 feet over surface of surrounding ground. Those proposed to be dealt with are from 9 inches to 1 foot 4 inches. Unless there is an open area 2 feet 6 inches wide. The area proposed for these dwellings is 8 feet wide at back and 6 feet in the front. Unless the cellar is properly drained, which these will be, the drainage proposed to be taken to the back and not through the houses. Unless there is a proper w.c., which they have. Unless there is a fireplace, &c., which all of these proposed dwellings will have. From the foregoing it will be noticed that we more than comply with all the exceptions except in the one case, and that is, that the ceiling does not stand 3 feet over the ground; but in my opinion these basements as proposed will receive more sunlight and air with areas 8 feet and 6 feet wide respectively than with 2 feet 6 inches wide, as proposed in the Public Health Act. Sir Charles Cameron is opposed to the lettings at the rents proposed; in that case, what is to be done with the houses? They cannot be let to single families, unfortunately, as there are none to take them, and are they to be allowed to go into ruin and decay, and remain as at present in the occupation of poor roomkeepers, paying no rent? If the Blue Coat Hospital authorities will take them at a reasonable rent, put them into proper repair and guarantee to let them to one family only, it would undoubtedly be a good arrangement and most unobjectionable; but I have seen no such offer. If, however, the basements in this case are so strongly objected to, why not use them for washhouses, and I am sure the other tenements in the house could afford to pay an additional sixpence a week for the sole use of them for one day each. At present I can see no reason to object to the alteration as proposed."



ARUNDEL WATER-SUPPLY.

THE articles of agreement between the Duke of Norfolk and the Corporation of Arundel relating to the water-supply have been signed. The Duke agrees to pump and supply, at his own expense, water for domestic and other purposes for the use of the inhabitants of the borough and parish of Arundel, and to contribute towards the cost of a new scheme of sewerage and drainage for the borough and parish. In consideration of the Town Council carrying out an approved scheme of drainage the Duke offers to supply every house in the borough with an efficient water-supply, to lay the mains and erect the necessary pumping station and apparatus at his own expense, reserving to himself the right of passing water through the town mains to his own property outside the borough. He gives over the mains to the Town Council, and an average supply of 75,000 gallons per day, and a greater quantity available at 1*s.* per 1,000 gallons. The supply may be discontinued on a year's notice, but such notice will not be given before the end of two years. The Corporation will not make any charge for water rates to the consumer for domestic purposes, but the Town Council are at liberty to charge for all water supplied to any house or premises above thirty gallons a day for each occupant of a house. Other provisions are that the Corporation should use their best endeavours to divert Mill Lane; agree to sell Gorringe's meadow for 500*l.*; and to carry out a complete scheme of drainage in four years, towards which the Duke of Norfolk will contribute 1,000*l.* in payment by instalments of 250*l.*, payable when the work is completed. The Corporation will connect their sewers with the drains of all the houses and cottages in the borough at their own cost, and defray all costs and charges incurred in such work out of the current rates, and they shall not borrow money for the purpose of such work without the consent of the Duke.

THE MERSEY BAR.

ACROSS the estuary of the river Mersey there exists a broad ridge of sand which seriously interferes with the navigation of the river. Vessels of deep draught cannot go over the bar except for a couple of hours before and after high water. This involves not only a loss of time, but a serious risk of danger while the vessels are cruising about waiting for the tide. The bar is supposed to be produced by the action of the tides, the sand which is held in suspension being precipitated in the slack water, where the ebb and the flood tides meet. The Mersey Dock Board, who are the conservators of the river, have hesitated to meddle with the bar, lest by shifting the sand in one quarter they might create greater mischief elsewhere. Some time ago, however, it was determined to make an experiment for the removal of the bar, or at least for deepening the channels of navigation which now intersect it. It was resolved to use steam dredges of great power. The vessels are fitted with adjustable pipes, the nozzles of which pass over the surface of the sandbanks, and, by means of pneumatic pumps, suck up the sand and discharge it into barges alongside. By these

barges the sand is carried away to distant places, where it is deposited. Mr. G. F. Lyster, engineer to the Mersey Board, in his official report just issued, gives the results of the operations so far as they have proceeded. After less than a year's work the quantity of sand removed up to the present time is 350,000 tons. The original estimate was that the removal of 800,000 tons of material would, provided there was no re-deposit, effect a deepening of 6 feet 6 inches below the shallowest depth then found, viz. 11 feet below low-water spring tides, for a length of channel of 3,000 feet, with a width of 1,000 feet. The amount removed up to date—viz. 350,000 tons—is equal to seven-sixteenths of this whole quantity. Comparing the most recent soundings with those taken at the commencement of the operations, it is noted that in the immediate proximity of the line on which the dredging is proceeding there were originally several soundings showing a minimum depth of 11 feet below low-water spring tides, whereas at the present time the shallowest soundings in the immediate proximity of the line show depths of 13 feet and 15 feet below the same *datum*, the deepest soundings being some 300 feet northward of the leading line, where depths of 15 feet and 16 feet are indicated. It may, therefore, be fairly inferred, Mr. Lyster thinks, that the improvement is attributable to the dredging operations.

BUILDING WITHOUT AN AGREEMENT.

On Monday, at the Sussex Summer Assizes, the case Hill *v.* Stephens was heard before Mr. Justice Hawkins. The plaintiff, Mr. Charles Hill, builder, of Brighton, sued Mr. Stephens to recover 274*l.* 9*s.* 2*d.*, for work and materials supplied. The defendant put in a counter-claim for 200*l.* Counsel for plaintiff said the amount claimed was the balance of an account for work done and materials supplied in building two houses. The defence was that it was agreed that the houses should be built for 300*l.*, and in the alternative that the plaintiff's charges were excessive. The defendant also alleged that the houses were not built in a workmanlike manner and were unfit for habitation, and that for this reason they were unlet for some time, and for this the defendant claimed 200*l.*—The plaintiff, on being called, stated that in July last year the defendant called at his house and stated that he wanted two houses built. He had no plans. Witness said he did not mind undertaking the work. Defendant said he wanted some good houses, and witness asked what he would pay for them. Defendant said he would pay 300*l.* Witness said he supposed he wanted two good houses, and defendant replying in the affirmative, witness said he must decline the offer with thanks. In three weeks' time defendant called again and said he had talked the matter over with his daughter, and they had decided that he should do the work. Witness then said they had better have an agreement, and defendant said he did not think it was necessary, as he had heard a good character of him. He said the chief thing was he wanted to keep the houses down as low as possible. They then adjourned to defendant's house, and witness said if he wanted the houses to keep he had better have rather thicker floor-boards than usual, and have Lancing brick and land sand used. He told defendant he had no capital, and he should require money to pay wages and some for capital. He duly carried out the work. After he had started the plans were altered, and he did extra work at the request of the defendant. Defendant came to see the work as it progressed, and gave orders to the workmen. The work he executed cost considerably more than 300*l.* There was no contract.—Cross-examined: He did not first speak to the defendant about the houses at defendant's house. Defendant did not tell him that he only had 300*l.* to lay out, and he (witness) did not say he could do the work for that. Mr. Stephens gave him an order, to an extent, to build the houses before he showed him the plans.—Re-examined: Defendant did not ask him what the houses would cost.—Frederick Richardson, a bricklayer, stated that he worked on the houses. Defendant was frequently there, and suggested improvements. He never told witness that the plaintiff had agreed to build the houses for 300*l.*—Cross-examined: Defendant instructed him to carry back the offices 2 feet.—Charles Anderson, a painter, stated that defendant was frequently on the job, but never told him that the contract price was 300*l.*—David Pearce, a plasterer, who undertook some plastering for 30*l.*, said defendant asked him to put in extra work if he could. Mr. Hill also ordered extra work to the extent of 8*l.* 10*s.*, and he was paid for this.—Mr. William Parnacott, the surveyor, stated that he had been over the two houses and measured them. It would be impossible to build them for 300*l.*—Mr. George Holloway, builder, also said the houses could not be built for 300*l.*—Mr. Mabson, assistant in the office of the Borough Surveyor, at Brighton, stated that he examined the houses and passed them.—This completed the evidence for the plaintiff. The defendant was then sworn, and stated that he sent a note to the plaintiff, and he came to his house and not to his place of business. His

wife and his daughter were present at the interview; his wife being present the whole time, and his daughter a part of the time. He showed plaintiff a plan, and asked if he could build the houses for 300*l.*, and he said he could and would do the work to his entire satisfaction. Plaintiff said he was willing to sign a memorandum. Witness told him he could finance him to the extent of 10*l.* per week until the time arrived for the completion of the work. No other conversation took place about the price, and he considered it conclusive. He never interfered with the work in any way. He did not give instructions for the back offices to be carried back 2 feet. The work was only carried out according to the plans. When he received a letter demanding the balance claimed by the plaintiff he was surprised. In reply to his lordship defendant said the houses faced the Corporation ashyard.—His lordship: A very agreeable spot.—In reply to further questions defendant said the houses were rated at 13*l.* a year. He let the houses at 10*s.* per week and paid the taxes. When the houses were first let they were not really fit for habitation. The chimneys were not carried up above the roof, and on one house there were no chimney-pots.—By Mr. Day: His daughter attended the same church as the plaintiff, and she recommended him as being a good honest man. He had not applied to any other builder to build the houses for 300*l.* He had offered to sell the ground to Messrs. Davey, but did not ask them to tender for the houses. They did not come to terms for the ground. He might have asked Mr. Strong to build the houses for 300*l.* He thought he did. Mr. Strong was very busy at the time, and said he would rather be without the job. He also spoke to Mr. Jackson about the houses, and his price was 350*l.* or 360*l.*—Re-examined: The houses were not finished at the present time. Whenever he spoke to people about the houses he always limited his capacity to 300*l.*—Miss C. H. Stephens, daughter of the defendant, stated that she recommended the plaintiff to her father believing him to be a straightforward man, and she was present when the plaintiff agreed to build the houses for 300*l.*—Mrs. Stephens also gave evidence to the effect that plaintiff agreed to carry out the work for 300*l.*—After his lordship had summed up the jury found that there was no contract, and the foreman said they felt there had been a misunderstanding.—Judgment was given for the plaintiff upon this point, and the question of value then arose, and it was decided to refer this to an arbitrator, together with the claim by the defendant for damages on account of alleged unnecessary delay.

FRYER'S VENTILATORS AND COWLS.

IN our recent notice of Messrs. J. D. & W. Fryer's ventilators and cowls we were able only to give an illustration of the cowls. We now give an illustration of Fryer's patent revolving

ventilators, as our description of them appears to have aroused considerable interest in these specialties of Messrs. J. D. & W. Fryer.

BRICKWORKS AT WEST HARTLEPOOL.

MESSRS. CASEBOURNE & CO., LIMITED, cement and brick manufacturers, of West Hartlepool, have just started new works on land lately acquired by them adjoining their cement works, for the manufacture of bricks by a patent process, the invention

of Mr. E. Cammiss, who has for many years been foreman of the company's brickworks at Cowpen. The process is designed for dealing with clays containing lime and other foreign matter, and which under the ordinary process would be unfit for the manufacture of bricks. In the first instance the clay is reduced to the consistency of thick cream in a wash-mill which eliminates all stones, &c. It is then pumped to the wet mill, where any stones larger than a pea are reduced and ground in with the slurry. From the wet mill it passes to the drying-flats, which are heated by waste heat from kilns and exhaust steam from engines. After drying it is ground in a perforated pan and conveyed by an elevator to the pug-mill, where, after being mixed with the minimum quantity of water to make the clay "bind," it is fed into the brick machine. This consists of a revolving table with a number of moulds, into which the clay is tightly pressed. The rough brick then passes automatically to the press machine, where it receives the final pressure, and comes out with the smoothness of a block of chocolate. The brick is then ready for the kiln, to which it passes direct.

The bricks when burnt are of good shape and colour, and have been favourably recognised locally from the fact that the company has already booked orders for some months ahead. The brick machinery has been constructed by Messrs. Bradley & Craven, Wakefield; slurry pumps, wet mill, &c., by Mr. T. Fawcett, Leeds, and iron corrugated roofing by Messrs. Motley & Green, Leeds. Plans for works were entrusted to Mr. C. B. Casebourne, of West Hartlepool, and carried out under the supervision of Mr. C. T. Casebourne, C.E., managing director to the company, who, with a number of gentlemen, including Mr. G. T. Reay, Mr. E. Cammiss, Mr. Craven, Captain Motley and Mr. W. H. Casebourne, witnessed the opening of the works early in July.

THE GERMAN EXHIBITION.

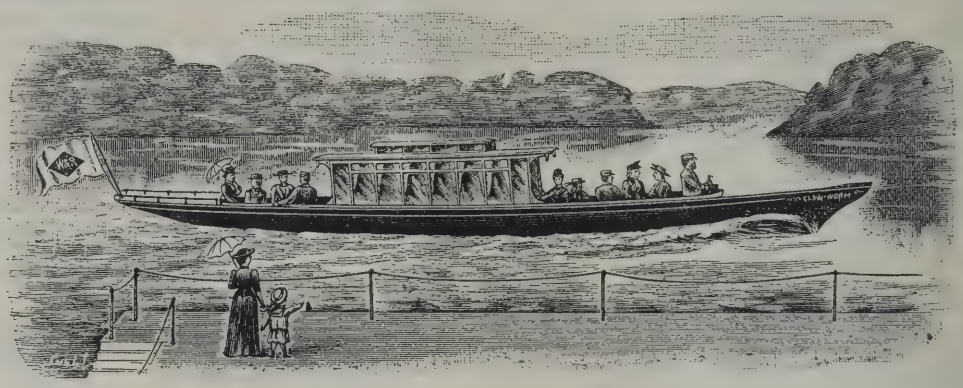
THE open air attractions offered to the public just now have probably had something to do with the postponement of the Promenade Concert season at Covent Garden. At the German Exhibition the authorities are sparing no efforts to make the military spectacle "Germania" as perfect as possible. With the alterations recently made, it might almost be said to be a new attraction. Not the least interesting addition to the performance is a well-contested full-uniform race by the cavalry, whilst a feature is made of the target practice in which a trooper of the Guards rides past a target at full tilt, and displays his marksmanship with both rifle and revolver. The management are working in the right direction in constantly adding to the attractions of the largest outdoor entertainment in London.

The "Welcome Club," which has been the "English corner" in all the international exhibitions held at Earl's Court, is now stronger than ever. From a membership of about 500, it has, during the run of the German Exhibition, increased its membership to close upon 1,200. The pretty grounds attached to the club have, no doubt, had much to do with its success, whilst the lady voucher system has been received with much favour. Mr. Owen, the hon. secretary, has been untiring in promoting the comfort of members and their friends.

Mr. John R. Whitley has received letters from Queen Victoria and the German Emperor, thanking him for the specially bound copies of the official publications of the German Exhibition which he had forwarded to their Majesties.

ELECTRIC APPLIANCES.

AMONG the exhibits of private firms at the Naval Exhibition now open at Chelsea is one belonging to Messrs. Woodhouse & Rawson United, Limited, of 33 Queen Victoria Street, London. This enterprising company have just completed, to the order of the British Government, the launch *Electric*, of which we give an illustration. This has been specially designed



for the conveyance of troops from one part of Chatham Dockyard to another, but it is intended to carry out with it an extensive series of trials, so that the merits of electricity as applied to the propulsion of small vessels may be thoroughly investigated.

At the company's launch works near Kew there are at present several launches, varying in size up to 50 feet in length,

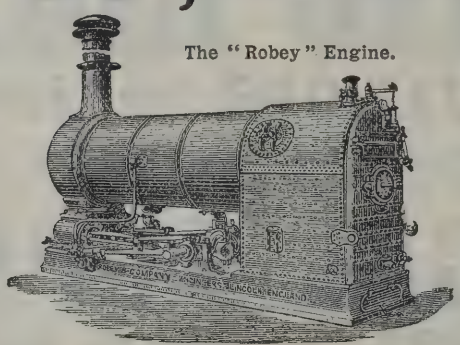
in course of construction. Models are shown of some recently-delivered, amongst which we notice one of the *Colondrina*, 53 feet long, which has been built for the Mexican Government. Although some of these are steam launches, it is satisfactory from an electrical engineer's point of view to know that the demand for electrically-propelled boats is increasing so rapidly that the company have felt it to be necessary to open a charging station near the works, where the accumulators may be recharged. From the illustration of the *Glowworm*, just completed for Mr. Pears, which will carry forty passengers and travel at the rate of nine miles per hour, it will be seen how much more convenient and pleasant these boats are than those in which the centre is occupied by a steam engine, however well designed or carefully constructed. To show how easily electricity lends itself to launch propulsion, the manager of the company's boat-building department has constructed a working model in which the screw is attached directly to the axle of the armature of the motor.

In another part of the stall we notice a small model of Bolton's electric winch. The high speed at which an electro-motor economically rotates is in this machine reduced by means of a screw gearing into a toothed wheel. The company have great confidence in this special application of the electric current, and are sure that it only requires to be more generally known to be extensively adopted. While search-lights of all sizes are shown at this exhibition, the company invite inspection of a model which will soon find favour with the naval authorities. Instead of a mechanically-worked arc, the light is obtained from an incandescent block of marble. This lamp was introduced some years ago as the "Sun" lamp, but owing to defects in design, it did not meet with much favour. It has, however, now been perfected, and is about to be introduced to the English market. Its perfect steadiness and freedom from mechanism will commend it to all. The company also exhibit a number of hand-lanterns made of thick glass, in which the incandescent lamp is entirely enclosed, so that there may be no danger from breakage as the lamp is carried from one part of the ship to another. There is also a selection of lampholders and lanterns for affixing to partitions and attaching to ceilings in fitting-up installations on board ship. The advantages of the single-stroke Jenson bell, particularly as adapted for signalling purposes on board ship, are shown to all who may be willing to pause for a moment, while it is almost needless to say that the quick-break switches, for which the company are so well known, are also shown. We notice that both in the sample of the 1,000 ampère, and the 3-way 500 ampère types, that sockets are provided for "sweating in" the cables. A 6-way distributing switchboard, and a number of Cunynghame Woodhouse & Rawson's magnetic cut-outs are also on view. These appear still to be in great demand, and although one of the first safety devices introduced, they appear to be still great favourites.



A fully detailed description of all the apparatus shown by this pushing firm would require far more space than we can at present spare. We would merely add that there are numerous

voltmeters, ammeters, tachometers, telephones, a fan worked by an electromotor, and other requirements necessary for electric light and power installations.

EXAMINATION QUESTIONS

THE following questions were proposed this year in the examinations of the City and Guilds of London Institute :—

CARPENTRY AND JOINERY.

Ordinary Grade.

1. In what way does pitch pine differ from deal, and to what uses is each applied?

2. State how you would determine the quality of good and bad wood by smell and colour.

3. By what names are the several qualities of Memel, Riga and Dantzic known? Give particulars of each.

4. It is required to cover a building 40 feet wide with a ridge roof, at an angle of 32 degrees. Give an elevation of the truss you would use (scale, 4 feet to an inch).

5. Give enlarged details of each joint of the truss you propose in reply to the foregoing question. Figure on the sizes of the timber and show ironwork.

6. Give sketches to a scale of half an inch to the foot of all the joints applicable to a wall plate, and state under what conditions they are commonly used.

7. Give particulars of the form of roof-framing known as "De Lormes," and explain same by sketches.

8. Give an elevation, to a scale of half an inch to a foot, for a centre to a 3-feet brick arch, 20 feet clear opening, with 5 feet rise. Specify the several sizes, and show joints by dotted lines.

9. It is required to cut an opening 12 feet high and 14 feet wide for a shop-front, in a newly-built 18-inch wall, 20 feet long and 40 feet high. Show the shoring you would use, and give the scantlings of the timber.

10. Explain by sketches the following terms applied to doors :—"Ledged and braced;" "framed, ledged and braced;" "bead butt and flush."

11. Give sketches, to a scale of half an inch to a foot, of the various joints used in a double-framed door.

12. Describe "joggling" and "indenting," as applied to beams.

13. Give plan and section of the frame and sash of a 3-light casement. Show by enlarged sketches how you would arrange to make it watertight.

14. What is the safe distributed load to be placed on a beam of Memel, 12 inches by 6 inches; opening 12 feet; the ends of the beam being fixed.

15. Give plan and section, to a scale of half an inch to the foot, of an open newel staircase, 3 feet 3 inches wide, stairs to land on quarter space at 9 feet from floor. Height, floor to floor, 12 feet. Width of hall, 7 feet 6 inches.

16. Show the setting out, to a scale of half an inch to the foot, of two lower curtail steps to a 4 feet 6 inches staircase. Explain their construction, with sketches.

Honours Grade.

1. Give a short summary of the various European firs, and state the purpose for which each is best adapted.

2. Give particulars and uses of four different kinds of oak.

3. Describe the following woods, their appearance and any special characteristics :—Teak, Kauri pine, spruce, white oak. Say from whence obtained, and for what purposes each is best adapted.

4. Give a section, to a scale of 1 inch to the foot, of a tusk tenon. Give Tredgold's rule as to proportion and position of the tenon, and state when the rule does not give the strongest result.

5. It is required to cover a clear space, 27 feet by 22 feet, with a lead flat, having a parapet wall on all sides. Give plan and section, to a scale of 4 feet to an inch, showing arrangement of timbers, gutters, drips, &c. (The plan need only show one half of the flat.)

6. A party wall has to be rebuilt to a four-storey house. Front wall 45 feet high to top of parapet. There is a basement and there are cellars under the pathway. Give sketches, to a scale of 4 feet to an inch, showing how you would shore up the front wall.

7. It is required to erect a temporary stand, to accommodate 100 persons, to view a procession. Site available, frontage 33 feet 4 inches, depth 15 feet. Give half plan and complete section, to a scale of 4 feet to an inch, showing the construction.

8. It is required to erect an overhanging wooden bay window at the first floor level. The bay to be 7 feet wide, with 2 feet projection. Give sketch to a scale of half an inch to the foot, showing construction.

9. Show by plan, to a scale of half an inch to the foot, how you would arrange folding shutters to a window opening

6 feet 6 inches wide, in an 18-inch wall. Show linings, architraves, &c.

10. Give an elevation, to a scale of half an inch to a foot, of a centre for a gauged brick arch in a 2-feet 3-inch brick wall. Clear opening 18 feet, with 17 feet rise. Show wedges, &c., complete.

11. A wooden beam constructed of two 14 inches by 4 inches deals, having a 1-inch wrought-iron flitch, has been placed across a 12-feet opening. State what is the safe load that it should bear. Also state what difference it would make if the flitch were reduced in thickness to half an inch.

12. A girder over a clear space of 25 feet has two binders secured thereto, each at a distance of 8 feet from the end, and each transmits a weight of 5 tons to the girder. State what should be the section of the girder.

13. Give section and plan, to a scale of half an inch to the foot, of a shop front. Frontage 20 feet. It is required to give light to the basement through the stall board. (The upper portion of the shop front need not be shown.)

14. Show how you would set out a moulded handrail to a geometrical staircase, which has 8 winders. Well-hole 1 foot in the clear.

15. It is required to place a wood-framed octagonal ventilating turret, 4 feet 6 inches in diameter, rising 10 feet above the ridge of the roof. Give section and plan to a scale of half an inch to a foot.

16. Show by sketches how you would obtain the intersection of a circular wood rib to an octagonal, and also to a circular pendentive.

BRICKWORK AND MASONRY.

Ordinary Grade. Section I.

1. If small pebbles are allowed to remain in clay used for making bricks, what is their effect upon the brick when burnt?

2. What precautions should you consider it necessary to take in using road-drift instead of sand for mortar?

3. What should be the width and thickness of the concrete foundation for a 2-brick wall in ground of a somewhat treacherous character?

4. Draw, to a scale of 1 inch to the foot, plans of two successive courses of bricks, at the angle of a house where a 2-brick wall meets a 1½-brick wall English bond.

5. Explain fully the fundamental difference between limes and cements. How is Portland cement manufactured?

6. What is tuck-pointing? Give your reasons for approving or disapproving of it.

7. What materials are chiefly used for damp-proof courses, and how are they applied?

Section II.

8. Describe any artificial stone that you may be acquainted with, and state the purposes for which you would use it.

9. The wall of a building is to be 18 inches thick, and to be built of ashlar stone, backed by brickwork. Draw a vertical section and a horizontal plan of the wall, each 6 feet long, to a scale of 1 inch to the foot. Explain the precautions which a mason should take in building the wall.

10. Draw, 1 inch to the foot, a section through a stone window sill, 6 inches deep in a 14-inch brick wall, showing the wooden sill of the window also.

11. Explain fully how a plain surface is formed on a large block of rough stone.

12. What ill effects should you consider likely to result from the beds of the stones used in a building not being worked perfectly true over the whole surface?

13. Describe the nature and properties of the principal building-stones used in your district.

14. Explain fully what is meant by "bedding sills hollow," and why this is necessary.

Honours Grade.—Section I.

1. Write a specification for the composition of concrete (*a*) for foundations of a heavy building in a damp soil, and (*b*) for arches between iron girders to form a floor.

2. What is the effect of severe frost on mortar and concrete? What precautions should be adopted with brickwork which must be carried up in frosty weather?

3. Explain fully how you would construct the foundations for a large building in marshy ground, where no solid bottom can be obtained.

4. Explain what is meant by rich and poor limes. Which will carry the most sand, and for what purposes are they respectively used?

5. What proportion should the least thickness of a brick pier bear to its height? Calculate the greatest safe load for a brick pier 3 feet by 2 feet 3 inches and 10 feet high.

6. Describe the different kind of materials used for paving in your district.

7. The accompanying diagram represents the front wall of a corner house. It is desired to remove this wall entirely in order to turn the ground floor into a shop, and to carry the

upper portion of the wall on a girder. Describe fully, by means of diagrams, how you would shore and support the house during

the insertion of the girder. There are two storeys above the ground floor, and the total height of the wall from ground to parapet is 32 feet.

Section II.

8. What is the composition of the following stones, and for what purposes are they used :—Ancaster, Beer, Bramley Fall, Craigleith, Caen, Kentish rag, Portland?

9. Explain, by means of a diagram, the true object of buttresses in such a case as the external wall of a church, and the theoretical value of pinnacles crowning them?

10. Find the thickness of a rectangular wall 16 feet high, built of stone, weighing 145 lbs. per foot cube, which will just turn over under a wind-pressure of 40 lbs. to the foot super. The strength of the mortar may be neglected.

11. Draw a plan and elevation, ½ inch to a foot, of a three-light lancet window in a stone wall 3 feet thick, the extreme clear height being 14 feet and the clear total width between the inner sides of the jambs 8 feet.

12. Describe the different kinds of vaulting to be met with in English ecclesiastical buildings.

13. Describe how you would roughly test the weathering properties of a stone when time would not admit of a practical trial.

14. In building walls of coursed rubble with ashlar quoins, describe fully the points that ought to be specially attended to, and write a short specification for the composition of the mortar.

PLUMBING.

1. Where the supply of water to a valve closet is restricted by the water company, describe briefly, and show by rough sketches, the kind of water waste-preventer you would recommend; state the size of the pipe you would fix to supply the waste-preventer from a cistern fixed about 15 feet or 20 feet above it, and the size of the service-pipe you would fix between the waste-preventer and the closet-basin.

2. Understanding a tack for a lead soil-pipe to be a piece of lead about 9 inches by 9 inches, or 10 inches by 9 inches, and an ear or lug to be a thick piece of lead cast or cut to shape, about 2 inches by 2 inches, to match, it may be, the ear of a neighbouring cast-iron rain-water pipe, how many tacks would you solder to a stack of soil-pipe 50 feet high, for securing it to a brick wall, and how many wall hooks would you fix to each tack; or, if ears were insisted on, how many ears would you solder to the 50-feet length of piping? Show by rough sketches how you would solder the tack and ear respectively to the soil-pipe, and state which of the two methods you would prefer to adopt for securing the pipe to the wall, and give reasons.

3. It is required to fix a stack of soil-pipe in a chase in the internal face of an external wall of a four-storeyed house, with a branch from a closet on each of three floors, the closet on the ground-floor being of the pedestal wash-down kind, with an earthenware trap; that on the first floor being a valve-closet, with a lead trap; and the one on the third floor being a wash-down basin, with a lead trap under it, and a table-top for receiving slops. Describe briefly, and show by rough sketches, how you would treat the whole of the plumbers' work, the cistern for supplying the water being fixed on the fourth floor, directly over the closets, with no restriction as to the supply.

4. What are the properties of lead, and from what ore is lead chiefly obtained? Briefly describe the best process you know of for extracting lead from the ore, and running it into pigs, and how pigs are converted into sheets and pipes respectively.

5. How would you secure lead hips to roofs that are nearly vertical, with wings or sides on the slates, 6 inches wide, so that the lead may be retained permanently in its position, and what should be the maximum length of the pieces of lead you would fix for the purpose?

6. A range of four flushing-rim valve-closets is to be supplied from a cistern, 15 inches deep, fixed directly over, with its bottom 4 feet above the top of the closet, and one general service-pipe is to be fixed from the cistern with a branch to each closet. State the sizes of (*a*) the general service-pipe, (*b*) the branches, and (*c*) the supply-valve to each closet.

7. How would you fix the apron flushing, cover a torus roll and finish off the edge of a lead flat on the top of a high-pitched slated roof? Give sections.

8. Apart from increasing the durability of a cast-iron drain-ventilation-pipe by galvanising it, what advantages are gained by protecting such a pipe from rust, and what important points should be borne in mind in selecting the positions for the outlet of ventilation-pipes of soil-pipes and drains?

9. Mention the important features of the best kind of wash-out closet with which you are acquainted, and describe and give sketches showing how you would connect it to a lead soil-pipe. What objections on sanitary grounds are there to the adoption of this kind of closet?

10. State the proportions of lead and tin for making (*a*) fine solder for copper-bit work, and (*b*) plumbers' solder for wiping purposes. What are the melting-points of each kind of solder and of lead and tin respectively?

11. Two valve-closets, one on the first floor and the other on the second floor of a house, each with a 4-inch round pipe-trap under it, are connected by 4-inch branches to a stack of 4-inch soil-pipe carried up full bore to the roof for ventilation. What would be the effect upon the seals of the closet-traps and the overflow-traps of the closet-basins by the discharge of pailfuls of slops through the upper closet, and if any evil arose how would you remedy it?

Honours Grade.

1. Are traps of any value for keeping noxious gases out of a house, and on what principles should they be made for valve-closets, sinks, baths and lavatories? Give rough sketches of the various traps for plumbers' work with which you are acquainted, and state their advantages and disadvantages.

2. Describe the essential features of a good valve-closet, and compare the best kind of modern valve-closet with the old Bramah closet, and state the best method of supplying a flushing-rim valve-closet.

3. In the case of a four-storeyed house, where the soil-drain runs from the back to the front, and there is no space or area outside the external walls, the whole of the site being occupied by the building, how would you disconnect the drain from the sewer, and how would you treat a rain-water pipe to be carried down the centre part of the house, and a waste-pipe from a range of three lavatory basins situated on the first floor in the centre part of the house? Give rough sketches.

4. Why does soft water act more on lead than hard water? In which case would the action of pure water on lead be more likely to render it unfit for potable purposes, when the lead cistern and its service-pipes are kept fully charged with the water, or when they are only occasionally charged? And where the water could not be drawn from the water company's main, of what material would you recommend the cisterns to be made for storing water for drinking purposes, and where should the cisterns be placed?

5. In certain cases of sewage disposal, where it would not be advisable to allow the grease from the scullery and kitchen sinks to be sent into the drains by a flushing arrangement, describe and give sketches showing how you would arrange for the interception of the grease, and state the advantages and disadvantages of intercepting grease from the house-drain.

6. Explain how cistern and other filters can become contaminated and be the cause of greater evils than those they are intended to prevent. Describe the best filter with which you are acquainted and how you would arrange for a supply of filtered water on the first floor of a house and in the butler's pantry.

7. Describe briefly and roughly sketch a lead-burning machine, and mention a few cases where it is essential that the edges of the leads or their laps should be burned instead of soldered, and describe the operation of burning.

8. What objections would you have, if any, to supply a draw-off cock with water for potable purposes from a cistern which also supplies by a separate service-pipe a valve-closet with a supply-valve and regulator attached to the closet? Would you prefer drawing drinking-water direct from the communication-pipe (rising-main) from the water company's main without constant supply or from a cistern? Give reasons.

9. There is a small stream of soft water suitable for potable purposes about a mile distant from a house which is occupied only three times a year and for about six weeks on each occasion. The stream is at a sufficient height to allow the water to gravitate from it to the house, but the supply which could be taken from it daily would be equal to about 500 gallons only, which is about half the quantity needed when the house is in full occupation; and about midway between the stream and the house there is a depression in the ground of about 20 feet, which the water-main would have to follow. How would you arrange for a proper supply of water to the house at all times during its occupation, what kind of pipe would you use for conveying the water, and what should be its size, and how would you treat the main at the depression in the ground? Give sketches.

10. It is proposed to lay a stoneware drain, about 150 feet in length, outside the external walls of a house that is occupied by about twenty persons, to receive the discharges from three stacks of waste-pipes from sinks, baths and lavatories, one stack of waste-pipe from two slop-sinks into which three stacks of soil-pipe discharge, and the rain-water and surface-water from a superficial area of about 3,000 feet. Briefly describe and

give rough sketches showing how you would disconnect the drain from the sewer; give a transverse section through the drain, and state its size, and say how the joints should be made.

11. Two wood cisterns, each 3 feet 5 inches by 3 feet 4 inches and 3 feet deep inside, are to be lined in position with lead—that for the sides weighing 6 lbs. to the superficial foot and that for the bottom 7 lbs. to the superficial foot—and to be supplied by a ¾-inch rising-main, with a ¾-inch Croydon ball-valve, with a pressure on it of about 15 lbs. to the square inch. State the sizes and numbers of the pieces of lead necessary to line the two cisterns, and the length of sheets, 7 feet wide, you would require from which you would cut the sides and bottoms respectively. Describe how you would line the cisterns, state the total length of soldered angle in the two cisterns, and give sections of the horizontal and vertical angles, showing the soldering and the edges of the lead. Describe how you would connect the two cisterns together, and provide against an overflow of water in the case of the ball-valve getting out of order. Give rough sketches showing the relative positions of the connecting-pipe, the overflow-pipe and the ball-valve.

A NOVEL ELECTRIC LAMP.

In a recent lecture before the American Institute of Electrical Engineers, Mr. Nikola Tesla, the well-known electrician, described some experiments he has made with alternating currents, which promise in the future a new kind of electric lamp, different from those in use in that it would require no connections, and consist merely in a vacuum tube which would give a light wherever it was placed. Mr. Tesla was able to make his discoveries by inventing an alternating current dynamo producing a current having no less than a million reversals per minute. When this current was passed through the primary wire of an induction coil two fierce flames like those of a torch were seen to tip the terminals of the secondary wire. The flames were hot and brilliant, yet they were consuming no fuel, and were simply an electric discharge of the "brush" type. When a glow lamp containing a wire or a piece of carbon was held to one of the terminals it was seen to be filled with light, the wire or carbon becoming white hot, although there was no circuit for the current. Moreover, when the terminals of the secondary wire of the induction coil or transformer were connected to two large metal plates opposite each other, the space between these plates was found to be so excited by the electrostatic effect of the charges that a vacuum tube or bull, containing a slip of metal foil, placed between the plates yielded a glowing light. Mr. Tesla calls this the ideal mode of illumination, the tubes having no connections, yet yielding a soft agreeable light. A room having such plates in opposite walls would furnish a light in any part by the mere act of placing one of the vacuum tubes there.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

12741. Samuel Barrass, for "Improvements in window-sash fasteners."

12748. Léon Covilbaud, for "Improvements in draught-excluders for doors and windows."

12762. William Scott Morton, for "Improvements in making ornamental panels or decorating material for walls, ceilings or other surfaces."

12769. John Rhodes, for "Improvements in or connected with springs and checks for the closing of doors."

12790. Thomas Bass, for "A new or improved shutter and door-fastener."

12878. Henry Audley Miller, for "Improvements in bolts."

12900. David Osborn, for "Improved apparatus for opening, closing, securing and adjusting fanlights, skylights, swing sashes and the like."

12930. Samuel Hill and Rowland Hodges, for "Improvements in and connected with door-closing springs and checks."

13059. William Barnsley Hughes and Charles Young, for "New or improved apparatus for fastening fanlights, windows and the like."

13103. Isaac John Evans, for "Improvements in lathes."

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our DESIGNS, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, J. H. PICKUP & CO.

SEDDING MEMORIAL VOLUMES.

THE list of subscribers to this work is now nearly full, and it is intended to raise the price of the volume immediately after publication. Besides ten large photos of Mr. Sedding's buildings (negatives 15 by 12), there will be five plates of facsimile reproductions of his sketches, five plates of sketches of his buildings, and ten plates of his designs for embroidered frontals, stalls, hangings, borders, &c., wall-papers, memorial brasses, wrought ironwork, candlesticks, crosses, staffs, &c. Subscription forms may be obtained of Messrs. Batsford & Son, Holborn.

NOTES ON NOVELTIES.

Ventilators.—The "Climax" Ventilating Company write to us :—"In your last issue, under the heading 'Ventilators,' you kindly referred to certain ventilating works we are carrying out at home and abroad, but, in so doing, you referred to Mr. Arthur W. Stephenson as being the engineer to this company, whereas he is the engineer for the erection of the cotton and jute mills referred to. We shall be glad if you will make the necessary correction and oblige." The company also inform us that they have received the following testimonial from a well-known architect :—"Having used your ventilators, I have pleasure in testifying to their thorough efficiency. I have had experience of many others, but am convinced that your direct-acting ventilators are the best in the market, and will continually specify them in my work."

[The misconception, viz. that we referred to Mr. Stephenson as engineer of the "Climax" Ventilating Company, has not unnaturally arisen from the accidental omission of "by" after "Mr. Arthur W. Stephenson."]

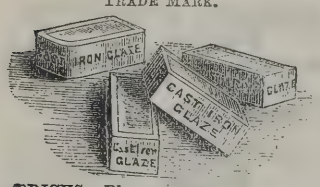
BUILDING AND BUILDERS.

MR. WALTER SCOTT, contractor, of Newcastle, who is a native of Abbey Holme, has placed in the east chancel window of Holme Cultram Abbey Church a stained-glass window in memory of his wife, his parents and other members of his family.

THE Plans Committee of Aberdeen Town Council have sanctioned the plans of extensive additions to Union Works, Poynernook, the Aberdeen premises of Messrs. A. Pirie & Sons, Limited, paper manufacturers. It is proposed to erect two large fireproof buildings, and to heighten one of the existing buildings, and the cost of the extensions is estimated at 25,000*l*. Messrs. Jenkins & Marr are the architects. Messrs. James Bannochie & Sons, Belmont Street, have received the contract for laying the concrete foundations of the additions.

THE *Carlisle Journal*, in announcing the death of Mr. Thomas Milburn, aged sixty-seven, says he was formerly and for many years a builder in Carlisle. By his energy and untiring industry he made for himself a competence, and retired from business a few years ago. He was a member of the Town Council for Botchergate Ward for several years, and in 1878-9 filled the office of mayor to the satisfaction of the citizens. He was subsequently appointed a magistrate of the city. As an active member of the Health Committee and the Town Improvement Committee he did the city much good service, and the public often reaped the benefit of his practical knowledge of the building trade.

THE School Buildings Committee of the Aberdeen School Board have sanctioned an addition to St. Paul Street Public School.



THE Jarrow Town Council have decided to erect a suitable building for technical education at a cost of 3,000*l*., provided the Durham County Council agree to pay the Corporation 1,000*l*. out of this year's grant.

THE new chapel, erected at Longshawe for the Duke of Rutland from the plans of the Duke's architect, Mr. King, has just been opened.

THE work of building the Price Memorial Hall in Brunswick Road, Gloucester, has begun. Mr. William Jones, of Gloucester, is the builder.

TWO reports from Mr. Lockwood, architect, of Chester, on the scheme for the erection of the Oswestry Municipal Build-

ings, the selected architect for which is Mr. H. Cheers, of Twickenham, were read at the meeting of the Town Council. The following motion was then agreed to :—"That the Council be recommended to carry out the competition plans with the exception of the alteration required by the Local Government Board and the slight alterations suggested by the Free Libraries Committee and accepted by the Council, and that the raising of the building be abandoned owing to the extra cost, it being understood that no extra charge be made by Mr. Cheers for the preparation of the extra plans and quantities thus necessitated." It was further decided that parties who sent in tenders should be invited to send in fresh tenders upon the revised plans and quantities. A reduction of 1,000*l.*, it is estimated, will be thus effected.

TRADE NOTES.

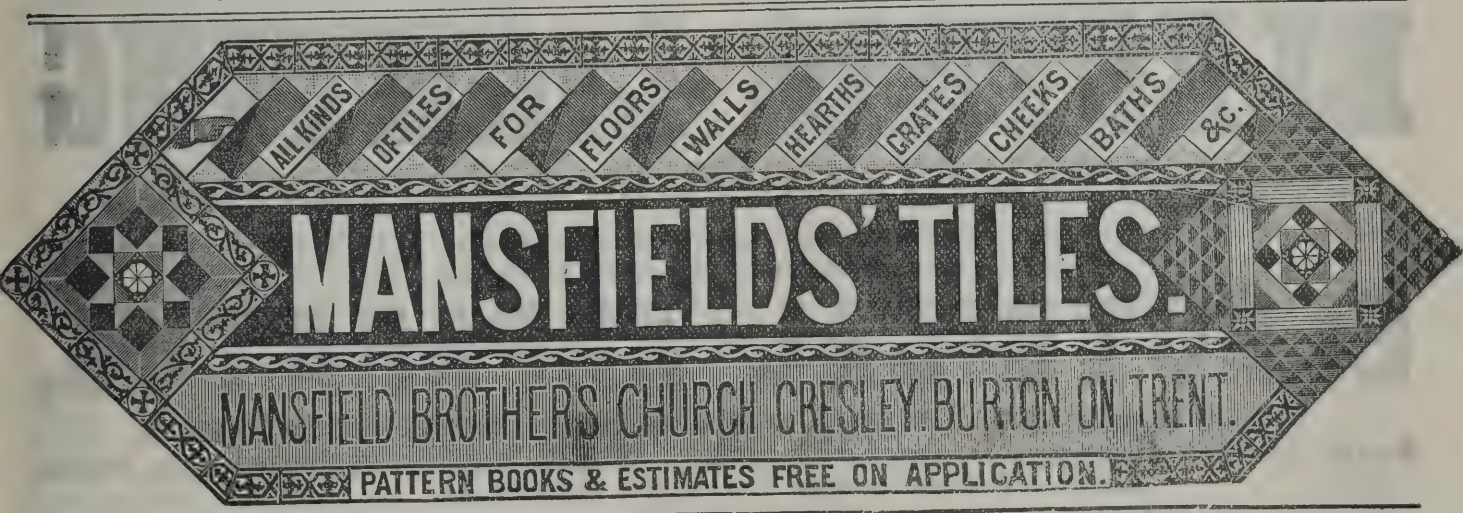
THE additions to St. Mary's Catholic Schools, Widnes, are being warmed and ventilated by means of Shorland's patent Manchester grates, which have proved satisfactory in the old schools, the same being supplied by Mr. E. H. Shorland, of Manchester.

AFTER considerable negotiations with various property owners, the Kegworth Parochial Committee have finally decided to enter into a provisional agreement to purchase 8 acres of land from Mr. Sidney Wells for sewage disposal purposes. Mr. W. H. Radford, C.E., of Nottingham, has prepared a scheme for the sewerage and sewage disposal, and this scheme has been passed by the Committee and by the Shardlow Guardians. It is proposed to lay down new pipe sewers in most of the streets, and special joints will be used where water is met with. There will be a short length of tunnel through the hill past the church. The sewage will all be delivered by gravitation to the sewage disposal site, where the outfall will be 12 feet below ground level. The sewage at the outfall will be pumped into the sewage carriers by means of a gas-engine and centrifugal pump. There will be a tank under the engine-house for night storage, of such a capacity that it will only be necessary to work the pump for about three hours daily. As there is no suitable outlet for deep land drains and the soil is somewhat porous, the sewage would find its way too readily to the drains if arranged in the ordinary way; it is therefore proposed to keep down the subsoil water by merely surrounding each field with a large land drain protected by a bank. The sewage will be purified on the land by irrigation, and the soil is very suitable. Application has been made to the Local Government Board for sanction to borrow 5,000*l.*

THE premises of Messrs. J. Wilson & Sons, timber merchants, Bradford, have been almost completely destroyed by fire. The damage is estimated at 20,000*l.*

THE town of Larne has been illuminated with electric light for the first time. This is the first town in the North of Ireland which has adopted electricity for illumination.

THE Company of Armourers and Braziers will hold, in London, their third exhibition in May, 1892. The exhibits will mainly consist of objects executed in metal from original designs. Particulars as to the prizes offered and conditions of exhibition will shortly be obtainable from the clerk to the company.



AN order has been given by Messrs. A. Pirie & Sons, Limited, Aberdeen, for six steel Lancashire boilers to Messrs. James Abernethy & Co., Ferryhill. The boilers are to be of the most approved type, with corrugated furnaces, with welled flues, and are to work at 200 lb. per square inch pressure.

PLANS are being prepared for the construction of a new landing stage at Lambhay, for the Plymouth County Council.

THE tenders received for the proposed police station at Bury St. Edmunds have exceeded by a large sum the county surveyor's estimate. The plans, in consequence, will be modified.

A RECOMMENDATION before the Rhyl Commissioners that notice to purchase the gasworks should be given forthwith to the gas company, and application made to the Local Government Board for sanction to a loan of 38,000*l.* for the purchase, has been deferred till October for consideration.

THE award in the case of Newell, contractor, and the Liverpool Corporation has been made by Sir John Coode. He awards to Mr. John Newell, the plaintiff, in respect of his claim the sum of 14,423*l.* 10*s.*, and has given judgment for the plaintiff on the defendants' counterclaim. He has directed that each party shall pay his own costs of the reference and half the arbitrator's charges and costs of the award, which latter amount to 958*l.* As by the order of reference the costs of the action were to follow the event, the plaintiff takes the general costs of the action. The defendants' counterclaim was for penalties alleged to be due under the contract, and for the cost of the

FLUATE
FOR HARDENING AND PRESERVING STONE.
Apply to the Bath Stone Firms, Ld., Bath.

completion of the tunnel by Messrs. Cochrane & Sons, which cost the Corporation will now have to pay. The contractor claimed altogether 28,474*l.*, comprising 16,949*l.* for work actually done in the tunnel, 11,000*l.* for loss of profits, and 525*l.* for detention of plant. On the other hand, the Corporation made a counter-claim of 9,600*l.* for non-fulfilment of the contract.

THE iron bridge which the Leamington Corporation have erected in the Adelaide Road, at a cost of 2,000*l.*, has been officially opened. The new bridge has an arch span of 70 feet 5½ inches, and rests upon seven wrought-iron arch ribs. The height of the arch is 11 feet 8 inches from the spring.

A WATER-FOUNTAIN and trough is about to be presented by Messrs. W. Tuffill, of Rochester, to the city, as a memorial of their late brother, Mr. W. Tuffill. It will take the place of the ancient pump in Eastgate, and will be in Aberdeen granite.

AT a meeting of the Finance Committee of the Court-house Buildings Commissioners, to consider the question of the ventilation of the Sheriff Court-house Buildings, Aberdeen, it was agreed to remit to Mr. Kelly (Smith & Kelly) to report on a scheme of ventilation for the Court-house, the County Hall, and the Joint Town and County Hall.

THERE is a difference of opinion as to the sanitary state of the drains in the township of Stanwix and Etterby. At a vestry meeting of ratepayers the following resolution was adopted :—That a committee of six ratepayers be appointed to inspect the sewers and drains in the township of Stanwix and Etterby (with power to call to their aid a sanitary engineer if requisite) and to report to a future meeting.

THE Works Committee of the Aberdeen Harbour Board have agreed to extend the fish market wharf from the present termination to the graving dock, a distance altogether of 480 feet, at a cost of about 3,400*l.* It was first proposed to extend the wharf only 300 feet.

IT was reported at the last meeting of the Mersey Docks and Harbour Board, by the Marine Committee, that the 10,000*l.* authorised to be spent in dredging experiments on the bar at the mouth of the river was now expended, and that the Mersey Conservancy Commissioners had sanctioned the expenditure of a further sum of 6,000*l.* Mr. Crow, chairman of the committee, stated that up to the end of last month 420,000 tons of sand had been removed, the result being that whilst before the operations there was a depth of only 11½ feet at low water at some parts of the bar, a survey taken a fortnight ago indicated a depth of 16 feet over four-fifths of the distance across the bar on the eastern side, and a minimum of 13 feet on the western side.

AT the half-yearly meeting of the Great Western Railway Company, the chairman, in the course of his remarks alluding to the construction of bridges, said the Great Western was remarkably well off in that matter. Their old friend Brunel did not like cast-iron at all, and he put up some most beautiful wooden contrivances. All the cast-iron bridges on the line were carefully looked after and tested at the proper times, and the directors could not do more than go on replacing them as they had done for years past. There was nothing to be apprehended either in cost to the company or in the safety of the passengers from the cast-iron structures which existed upon the railway.

VARIETIES.

THE *Scotsman* says :—It is understood that the consulting engineers, Messrs. Gale, Hill & Mansergh, have recommended the Manor district as that to which the Edinburgh Water Trustees should look, in all the circumstances, as a new source of water supply. The report has not yet been printed, but it is further stated that in connection with the question of the cost of the scheme the engineers have very considerably increased the estimate of 664,000*l.* for 15,000,000 gallons per day from the Manor, which was given by Messrs. Leslie & Reid in 1890. It is suggested that the scheme should be proceeded with in two instalments. Under the first half the supply would be increased by 10,000,000 gallons, and under the second half by an additional 5,000,000 gallons.

THE Bootle Town Council require Mr. Blair, their surveyor, to reside in the borough instead of at Formby, where he has taken a house for twelve months, otherwise he will be called on to resign.

THE forest fires at Var, which have been at last extinguished, have destroyed 30,000 hectares of pine and oak trees.

THE new reservoir at Laurencekirk was completely wrecked on Saturday while some supports were being taken out. Mr. Scott, one of the contractors (Scott & Sellar, Aberdeen), had a narrow escape of his life. While employed in taking out the wooden centres supporting the roof, the whole collapsed, the sides bulging out and the roof falling in.

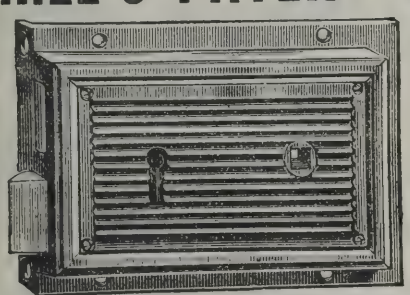
Works :—London, Manchester, Kidsgrove and Chiswick.

It is reported by Mr. R. C. Reid, C.E., Edinburgh, that the South Harbour Street wall, Ayr, has failed through its own inherent weakness, and from the fact that the foundation has been rendered insecure by the scouring action of the river, and, further, that this scouring action is in a great measure due to the artificial deepening of Ayr harbour. Mr. Reid recommends a new wall, to be founded on the shale or blaise under the clay, about 5 feet below low water. The cost would be 1,200*l.*

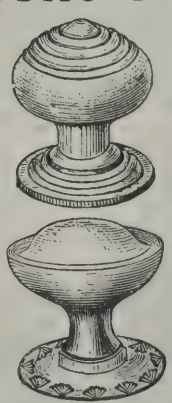
REMEDY AGAINST DAMP WALLS.

The Silicate-Zopissa Composition is manufactured by the Granitic Paint Company, of 84 Lombard Street, E.C. It is a washable distemper, and specially intended for damp walls, having the property of rendering walls and other surfaces to which it is applied proof against damp, and also contributing to their durability. Drying rapidly, hard and "flat," it produces a surface of great beauty. While rendering walls impervious to damp, it tends to retard decay in porous stone, bricks and tiles. For interior use it has the great advantage of not being liable to be rubbed off, and thus takes the place of whitewash or ordinary distemper colouring where formerly used. From a sanitary point of view, it is valuable for use in hospitals and all public and other buildings where there is likely to be risk of contagion. The application of the composition involves little trouble, but the instructions of the company as supplied by them should be strictly followed. If this is done (and the mechanical parts of the instructions are simply that the surface having been cleaned by brushing, &c., the composition is to be laid on with a painter's brush), it is claimed that the result cannot fail to be satisfactory.

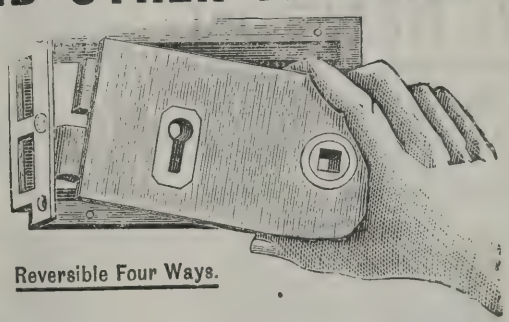


The granitic paint is another specialty of this company. The jury of the International Health Exhibition awarded a silver medal to the company for their exhibits of these goods. Like the zopissa composition it may be used either in or out of doors. It is suited for every style or kind of painting, and may be employed with success in producing decorative effects, or simply as a preservative for coarse and rough materials. Its other advantages are very numerous. Heat, moisture, frost or sea-air have no injurious effect upon it; it is, therefore, well suited to either tropical or cold climates, and is not liable to blister. It dries very hard, and at the same time possesses great fineness, durability and covering properties. These latter qualities make it a serviceable paint for all purposes required by architects, engineers, contractors, &c. As a preservative it is trustworthy in protecting wood and iron and such materials from rust and decay, and will make joints in ironwork fully equal to red lead. It is economical in use, as on iron and many other substances one coat is found sufficient and two coats give results quite equal to three of ordinary paint. It is ground in oil and supplied ready for immediate use. The company keep fifteen different colours and tints in stock, and any other can be made to order at rates cheaper than those for ordinary lead paint. As to the covering properties of this paint in the lighter colours, 1 cwt. of granitic paint will cover from 600 to 650 square yards of wood with one coat; and a similar quantity of one of the darker colours will cover from 800 to 1,500 square yards of wood. On iron or stone the covering properties of this paint are greatly increased.

CONTINENTAL TECHNICAL SCHOOLS.



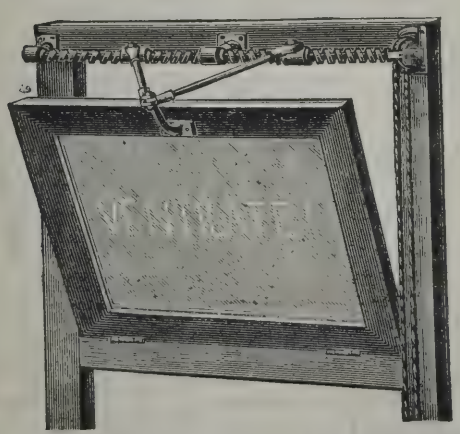
Within the last month a deputation from the Manchester Technical Schools visited several of the Continental and English institutions of a similar character. An exhaustive and interesting report is now presented, including plans explanatory of some of the buildings. It is believed that the view presented of the extent, character, aims, equipment and results of many of these important institutions, and especially of the efforts made to secure a due supply of properly-prepared students, may induce those immediately interested in and responsible for the promotion of technical training and instruction in this country to consider carefully the best means of applying the large sums now at the disposal of the public authorities for this purpose. It is to be remembered, continues the report, that the Continental technical institutions form part of an organised educational system; that they are recognised as essential to the development of the industrial arts, which depend for their progress upon the intelligence, knowledge and skill of those who control them; and that, in most cases, they are either supported by the State alone, or by the State and municipality jointly.



In Berlin the first visit was to the Handwerker Schule, which is an excellent example of a school for apprentices and young workmen engaged in various industrial occupations. It is open principally in the evenings and on Sunday mornings, and there are also day classes in the winter, when some branches of trade, such as painting and joinering, find little employment.

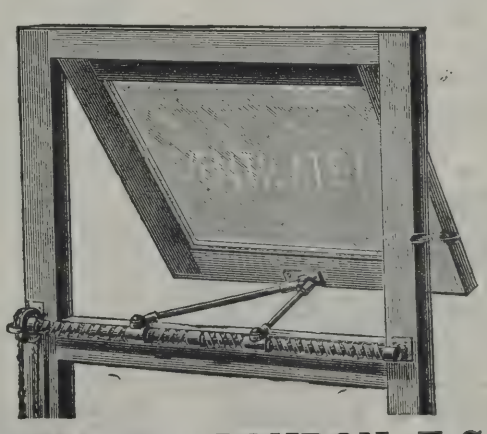
HILL'S PATENT LOCKS AND OTHER FITTINGS.

All kinds of Rim and Mortice Locks, Door Furniture, Sash and Casement Fittings, Swing-door Hinges, &c., kept in Stock.

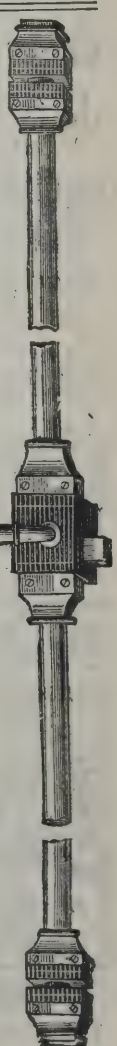


Reversible Four Ways.

Hill's Patent Gearing for Fanlights, Skylights, &c., made to suit lights hung every way, and worked with cord or rod on right or left side.



(Triple-Action Bolt.)



(Patent Bolt for Narrow Stiles.)

JAMES HILL, 100A QUEEN VICTORIA ST., LONDON, E.C.

There is also a special morning school for mechanics throughout the year. The fees, per half-year of about twenty-one weeks, for eight hours or less per week, are 6*s.*; for twelve hours, 9*s.*; for sixteen hours or more, 12*s.*; the day classes for joiners and painters, 5*s.* per month, and the Council may admit at their discretion needy pupils free. The students consist entirely of apprentices and young workpeople of the following ages:—1,169 from 14 to 17; 595, 18 to 21; 284, 22 to 25; 107, 26 to 29; and 57, 30 years of age and upwards. The highest number at any age was 378 at 16 years, while those over 21 are comparatively few. The occupations of the students embrace no less than 41 different trades and industries, and of 2,212 individual students only 43 were non-artisans. There were enrolled 287 mechanics, 279 house-painters, 215 joiners, 190 bricklayers, 150 locksmiths, 133 lithographers, 127 wood-carvers, 107 stone-cutters. The teaching staff numbers 45, and the engagement of teachers for special departments of technical drawing is a conspicuous feature. The average time per student in the summer half-year was $7\frac{1}{2}$ hours per week, and $7\frac{3}{4}$ hours in the winter. The municipality gives and maintains the building, and defrays all costs, so far as they are not met by the State subsidy. The expenses above the fees are 5,000*l.*, of which three-quarters are borne by the town and a quarter by the State. The estimates for 1891-92 include 1,000*l.* from the State and 3,815*l.* from the municipality. Though the rooms were crowded with students, the attention and excellent discipline were matters of noteworthy remark. No examinations are held or prizes awarded.

A school occupies part of the Museum of Industrial Art, which is of brick, with stone window dressings and string-courses. The brickwork is of the beautiful material of which so much is seen in Berlin; eight courses of alternate headers and stretchers, then a 6-inch band of ornamental red terra-cotta, the joints of the brickwork being $\frac{3}{8}$-inch wide and pointed up with a square-sunk joint. At the first and attic floors are deep bands of terra-cotta, with scrolls, panels and figures. The attic panels between the windows are decorated partly in Salviati mosaic on a gold ground, and partly in sgraffito. The windows are three-light, large, and finished with pilasters and cornices, which in the first floor have pediments. A bold cornice crowns the building, which has a wonderful effect of solidity and repose. There is a projecting *porte-cochère*, with a ramp leading up to it. The plinth and basement window openings therein are of stone, with the lower course in granite. In the centre of the building is a glass-covered hall, surrounded by granite piers, behind which is an arcade, two storeys high, lighted from the hall; on three sides beyond the arcade are two storeys of magnificently decorated rooms, with ceilings in narrow compartments, ornamented with composition looking like carved wood. The operations carried on are all those which are useful in a school of art of a very advanced character, but having a direct relation to the various art industries. A peculiarity of the establishment is that the professors have their own studios, and carry on their own work there, in which some of the pupils assist. These pupils are mostly, or have been, apprentices, and the teachers arrange terms of remuneration with their pupils who assist them. There are 582 students, of whom 131 are women, and the staff comprises 25 teachers. The day students pay 3*l.* 10*s.* for the winter half-year, and 1*l.* 16*s.* for the summer half-year; evening students, 6*s.* to 20*s.*, according to the subject and time of the year. There are several free scholarships for needy but proficient students, and free or reduced terms were granted to seventy pupils. The annual expenses amount to 4,620*l.*, the contributions of the students, in fees, to 1,030*l.*, the rest being found by the State.

The Royal Technical High School, Charlottenburg, has for its object the professional and technical training of men for the service of the State and for the higher departments of industrial life. It is an institution of the highest possible character. Its affairs are under the direction of the Minister of Public Worship and Education, and no person can get a Government appointment of a scientific and technical character without a certificate from this school. The school is organised in five divisions, and the instruction is arranged so as to carry research up to the highest attainable point in each of them. The divisions are architecture, engineering in its application to structures, mechanical engineering and shipbuilding, chemistry and metallurgy, general science, especially mathematics and natural science. The admission of students is conditional upon a certificate from a German gymnasium or a Prussian real-gymnasium (a classical and science school of the first rank), and making allowance for circumstances, a Prussian higher real schule, or an industrial school (Gewerbe schule), with a nine years' course and two foreign languages. The returns for the winter session, 1889–90, give 1,457 as the total number of regular and occasional students, the former amounting to 1,043. Of the total, 176 are foreigners, 10 of whom are Englishmen. The regular students are distributed as follows:—Architecture, 208; engineering applied to structures, 210; mechanical engineering, 358; shipbuilding, 142;

and chemistry and metallurgy, 145. The significance of these figures may be best understood by comparing them with the numbers in the respective departments of any English scientific institution of high rank. The chemical laboratories at Charlottenburg are carried on in a plain building of stone, separate from, but near to the Technical High School, and under its general direction. There are five inorganic laboratories for 83 students; three organic for 63 students; two technical laboratories, besides several private laboratories for the teachers. It was stated that there were 120 applications for admission to the inorganic laboratories. There are gas analysis, combustion and balance-rooms, the latter supplied with thirty balances, and a library filled with chemical works, together with very spacious store-rooms. The benches are arranged for four students, two on each side, and each laboratory contains a capital nest of small drying ovens, heated steam, as well as sand and water baths. The operations for quantitative and qualitative analysis are carried on in the same rooms, and are not separated, as is generally the case with us. The work of the laboratories is carried on in numerous small rooms. This is stated to be very practical, for if by breakage any emission of noxious vapours occurs it can be confined to a single room; but from subsequent inquiry and experience elsewhere, the deputation are inclined to doubt the wisdom of the arrangement, which certainly increases the difficulty of supervision.

REGISTRATION OF PLUMBERS.

AT the International Congress of Hygiene and Demography, in the section of State Hygiene, on Thursday last, a paper was read by Mr. W. H. Bishop, master of the Worshipful Company of Plumbers, who stated that it was the joint production of Professor Garnett, principal of Durham College of Science, and Dr. Vacher, medical officer of health, Birkenhead, on "The Education, Position and Duties of Plumbers." After the reading of the paper Dr. Thorne Thorne (Local Government Board), the chairman, proposed the following resolution:—"That this meeting approves of the action of the Worshipful Company of Plumbers for improving the education and position of plumbers."

Dr. Alfred Hill (medical officer of health for Birmingham) warmly supported the resolution. He said that plumbers, as a rule, were uneducated, and the registration scheme of the Plumbers' Company would have the effect of promoting their education. As a medical officer of health of many years' standing he had had many opportunities of observing the very prejudicial effect produced on the public health by the neglect of plumbing-work and the ignorance and incompetence of plumbers. The efforts of the Plumbers' Company had received the most cordial support alike from the public authorities and the plumbers of Birmingham.

Mr. T. Anderton (president of the United Operative Plumbers' Association of Great Britain and Ireland) cordially endorsed Dr. Hill's remarks. He urged that the very best sanitary inspectors were properly educated practical plumbers.

Professor Matthew Hay, M.D. (Aberdeen University), said it was important to notice the fact elicited from the remarks of Mr. Anderton, that the great body of the plumbers themselves were in favour of the registration system. Speaking for his own town (Aberdeen) he (Dr. Hay) could state that that system had made very great progress—all the master and operative plumbers there, with one or two exceptions, being registered plumbers. The Company's educational scheme had also met with strong support. For several years past plumbers' classes had been conducted at Aberdeen, and their success was evidenced by the high positions taken by the students at various examinations. The classes elsewhere had not been less successful, and he reminded his hearers that Bailie Crawford, at the special meeting of the Congress on Tuesday last, had stated that a student in the Glasgow plumbers' classes had taken the highest award in the United Kingdom.

Professor Corby, M.D. (Cork), urged the absolute necessity for specially training and registering plumbers in the interest of the public health. He stated that many diseases are directly attributable to defective plumbers' work, and he detailed from his own professional experience a number of instances in point. A particularly striking instance was that in which he had been called to a house where he found a little girl suffering from diphtheria. He inspected the sanitary arrangements, found them very defective, and ordered the child to be removed to a house where the plumbers' work had been carefully inspected and found efficient. The child after being removed speedily recovered. The parents then took the little girl to the country for change of air, and she came back in perfect health. The parents then returned to their original house, and within a week the child was again struck down with diphtheria.

Professor Garnett (principal, Durham College of Science) laid particular stress on the fact that plumbers' work is to a

great extent hidden and exempt from efficient inspection. Therefore he urged that every plumber should be so trained that he could execute his work with due regard to sanitation. He also emphasised very strongly the necessity for plumbers receiving specialised instruction. In conclusion the speaker pointed out that, inasmuch as it is quite impossible for the plumbers themselves to provide the funds necessary to give them such a thorough course of training as it is essentia to the public health they should receive, it is the duty of all public authorities to devote a substantial portion of the funds placed in their hands for educational purposes to the establishment and maintenance of special classes for plumbers.

The Chairman said that the Plumbers' Company would find an enduring monument of the great public work they had done in the lives saved by improved plumbers' work. There were a number of prominent gentlemen present who were anxious to add their testimony in favour of the registration system, but he was sure that all present were so thoroughly agreed on the subject that it only remained for him to take their formal votes on the resolution.

The resolution was then put to the meeting and unanimously agreed to.

At the special meeting held at Burlington House, in connection with the Seventh International Congress of Hygiene and Demography, on the subject of "The Education and Registration of Plumbers in Relation to Public Health," Sir Douglas Galton presided. Among those who supported him was the master of the Plumbers' Company (Mr. W. H. Bishop), the Lord Provosts of Edinburgh, Aberdeen and Dundee, Sir Philip Magnus, Sir George Wycherley, Bart., M.D. (Cork), Sir D. Maclagan, M.D. (Edinburgh University), Sir Henry Acland, K.C.B., Dr. George Buchanan, medical officer, Local Government Board, P. Gordon Smith, architect, Local Government Board, Professor W. H. Corfield, M.A., M.D., Dr. J. Maxwell Ross, medical officer of health for the county of Dumfries, Dr. Matthew Hay, M.D. (Aberdeen University), Dr. H. E. Armstrong, medical officer of health, Newcastle-on-Tyne, Professor Corby, M.D. (Cork), Professor G. F. Armstrong (Edinburgh University), Dr. Henry Tomkins, medical officer of health, Leicester, Alderman Evan Fraser (Hull), Councillor Kirtley (Leeds), Mr. E. Hart, Mr. J. Smeaton and others.

The Chairman, in opening the proceedings, said he did not know that there was any portion of the great Congress which was being held in that building which was of higher importance than the subject for the discussion of which the meeting had been convened. They were doubtless aware that the health of communities depended in a great measure upon the efficient carrying out of details of plumbing, and the Plumbers' Company had been most anxious during the last few years to improve the education of workmen engaged in this important branch of work. He could assure the Plumbers' Company he had always felt the warmest sympathy with their efforts, and he could bear witness to the work done by the Master and Wardens of the Company, and he might add that their efforts had produced the most valuable results.

The Master of the Plumbers' Company then read a short report he had prepared on the subject, in which he referred to the efforts made by the Company to extend among workmen a technical knowledge of the art of plumbing by the registration of qualified men. It was now about seven years since this work had been begun, and at the present time there were 950 persons engaged in the chief towns of the United Kingdom and Ireland in assisting to carry out the objects of the movement. The movement had, however, now reached a position when it was felt that it was necessary to give some legislative encouragement to it, and the Court of the Plumbers' Company had drawn up a draft Bill which they considered should be presented to Parliament during the next session, for the purpose of carrying out the proper education and registration of plumbers in the United Kingdom. On the motion of the Lord Provost of Edinburgh, seconded by Bailie Crawford (chairman of the Health Committee of the City of Glasgow), and supported by Sir Charles Cameron (medical officer of health for the city of Dublin), the following resolution was passed :—"That this special meeting of the International Congress of Hygiene, assembled to consider the necessity for securing the greater sanitary efficiency of the plumbers' work and the drainage of dwelling-houses and other buildings, desires to record its opinion that an organised and efficient system of registration of qualified plumbers is essential to the protection and preservation of the health of the community, and that such a system having been established in the chief cities and towns in Great Britain and Ireland by the joint action of the Worshipful Company of Plumbers, London, and the plumbers and sanitary authorities of those places, the time has now arrived when application should be made to Parliament for power enabling a Council of competent jurisdiction and authority to take measures for systematically promoting technical education among plumbers in all parts of the United Kingdom, and regulating

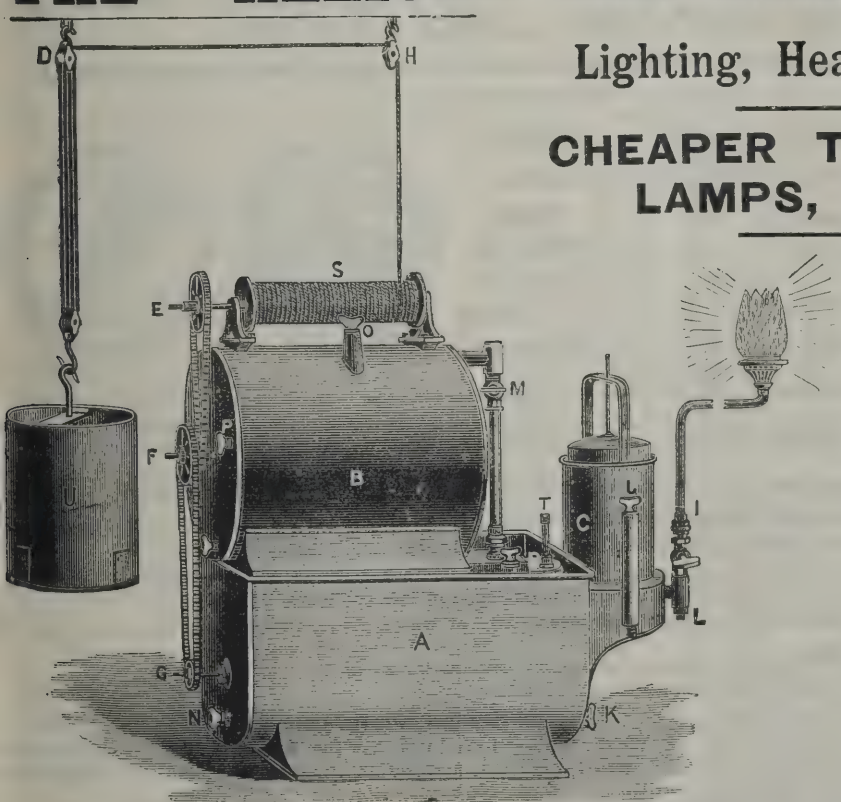
the practice of those plumbers who are enrolled as registered members."

The meeting was attended by a large number of mayors, lord provosts, provosts, chairmen of health and sanitary committees, medical officers of health and other representatives of the chief cities and towns of Great Britain and Ireland.

LIVERPOOL'S WATER SUPPLY: THE TUNNEL, FIDDLERS FERRY.

THE work of driving the tunnel at Fiddlers Ferry, for the permanent supply of water to Liverpool, is proceeding satisfactorily if slowly. The total length of tunnel required to be constructed is about 800 feet, and of this the work done by the present contractors during the greater part of the year only amounts to 155 feet, the limit reached at the time of writing. It must be, however, borne in mind, says the *Liverpool Courier*, that most exceptional difficulties have had to be overcome, and, taking these into consideration, the contractors are to be congratulated upon the success which has so far attended their efforts. The former contractors, Messrs. Monk & Newell, of Bootle, commenced on the Cheshire side, and sunk a shaft of 84 feet, afterwards driving a tunnel of 57 feet. They were, however, stopped by such an inrush of material that this portion of the work was then and there abandoned. A shaft was then sunk on the Lancashire side to a depth of about 100 feet, when, in January 1890, the contract was relet to Messrs. Cochrane & Sons, London. The present contractors elected to drive the tunnel at a higher level, and the boring was commenced by means of a circular shield, which is yet used for this purpose. Some months' delay was caused through difficulty in getting proper machinery to the work, but since the machinery arrived the progress, as has been stated, has been satisfactory, though the shifting nature of the material through which the tunnel has to be driven makes the work one of great difficulty. On July 29 work was suspended in consequence of some of the plates having given way, but these have been replaced, and by the 10th inst. all was right again. The new tunnel is only 50 feet below the surface, and as the river is 12 feet deep at this point the depth of the tunnel below the bed of the river is not great. On the Cheshire side the shaft was some time ago sunk to the required depth. The work in connection with the temporary scheme is now nearly completed. At present the supply of water to the city is carried across the river by a 12-inch pipe laid on the bed of the river by pipes of flexible steel. This pipe is 816 feet long, and contains fifty sections. On the Cheshire side the Ship Canal is crossed by a temporary 15-inch pipe which is laid on the bed of the canal, but this will soon be replaced by a temporary 21-inch pipe. This latter pipe will be sunk to a depth of 18 feet below the present bed of the Manchester Ship Canal, according to the requirements of the promoters of that undertaking. The 21-inch pipe is almost completed, only one joint requiring to be fixed. This will be connected with the other temporary pipe across the river, and thus enable the supply of water to be increased materially. Should this prove insufficient provision has been made for the laying of a duplicate pipe alongside the present temporary tubes, but the laying of such duplicate pipes would necessarily mean a very considerable expenditure of money.

COTTAGE HOSPITAL, BROMSGROVE.



THE engraving shows the new cottage hospital which has just been opened at Bromsgrove by the Earl of Coventry. The building has been designed on the pavilion system as a central block and two side wings, connected by corridors. The east wing contains the male ward called the Arthur Ryland ward, out of compliment to Dr. and Mrs. Chavasse, who undertook to erect and furnish it at their own expense. The ward on the west side is devoted to females. Each ward is 35 feet by 18 feet 6 inches by about 12 feet in height, with accommodation for six beds. In connection with the wards and at the rear are the sanitary offices, consisting of bathroom, lavatory (with nurses' sink) and water-closets. These offices are so connected with the wards that a cross-draught can be obtained to prevent any smell entering the wards. The centre block has a handsome entrance with vestibule and central hall, with corridors leading to the main wards. On either side of the main entrance are the day-room for convalescent patients and the matron's room, each about 16 feet by 13 feet. Leading from the central hall towards the rear is a passage, opening on to which is a linen-store and staircase to the upper floor, surgical ward, operating-room, dispensary, splint store, housekeeper's store, nurses' watercloset, and large kitchen about 16 feet square, with range, pantry and larder, small heating chamber, and a scullery which opens into the yard. Arranged round the yard are a mortuary (which will also be available as a wash-house and post-mortem-

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

FOR FURTHER PARTICULARS APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,

14 PALMER STREET, WESTMINSTER, LONDON.

room), a disinfecting chamber, a wood and coal store, and places for garden tools and ashes. The buildings are one storey in height, except the front portion of the centre block, which is carried up two storeys, and provides a large bedroom, which is available for an additional ward if necessary, three bedrooms for the matron and the nurses and two small store-rooms. Ample cellaring accommodation is provided in connection with the kitchen. The work has been carried out in sound, hard red bricks, with pressed bricks to the principal elevations, and

Grinshill stone has also been used to enrich the main entrance and certain of the windows. The gables are finished in half-timbered style, with solid oak timbers filled in with brick and cemented between, and with moulded bargeboards to over-hangings. The centre roof is hipped, and the roofs are covered with purple Staffordshire tiles. The inside walls of the wards are finished in Portland cement, with smooth face, as also the lower part of the internal walls generally. The dado of the operating-room is finished with glazed bricks.

The central hall is warmed with hot-water pipes, and the baths are supplied with hot water from a boiler behind the kitchen fire. The hot-water arrangements have been executed by Messrs. Ward, of Worcester. Sinks have been provided in the operating-room, the dispensary, the scullery and the mortuary. The ceilings are plastered, and the whole of the woodwork is stained and varnished, except that of the exterior, which is, of course, painted. Special arrangements are made as to ventilation and lighting. The wards and day and matron's rooms have wood floors, those of the wards being laid double with upper boards of narrow pitch pine. The vestibule and hall are laid with encaustic tiles, those to the vestibule being bordered ornamentally. The corridors and passages are paved with best blue and red quarries, laid to a pattern, and the kitchen and domestic offices have a flooring of the best red quarries. The matron's room and the day-room are provided with bay windows and a small balcony, with a beautiful wrought-iron railing, in which flowers can be placed, projects over the

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important Inventions of the Nineteenth Century.

PATENTED IN England, Belgium, France, Germany, Italy.

REGISTERED

TRADE MARK.

PATENTED IN Austria-Hungary, Denmark, United States of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1886.

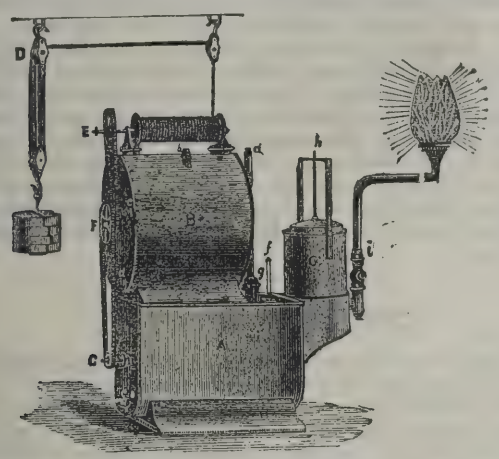
I have had some trials made with the KALLKOLITH during the past few weeks, the results of which are very satisfactory. The KALLKOLITH is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale. J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.

We are pleased to tell you that the KALLKOLITH supplied to us has been fairly tried, and we find that it answers all that you claim for it.

CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.



Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

central entrance. All the principal walls are 14 inches thick and the other walls 9 inches. The formation of paths and laying out of the ground has been done by the builder from the architect's plans.

The architect is Mr. John Cotton, F.R.I.B.A. (Messrs. Cotton & Bidlake, Bromsgrove and Birmingham), the builders being Messrs. J. Brazier & Son, of Bromsgrove.

THE "HELIOS" GAS-MAKING MACHINE.

Mr. Julius Moeller, the inventor of the "Helios" gas-making machine, has favoured us with further details as to its construction and working, which we have pleasure in submitting to our readers. Below is an illustration of the "Helios." For

he purpose of explanation we will divide the machine into two parts—A and B.

Part A—the tank—contains water, which keeps the hydrocarbon used at an equal temperature for its perfect evaporation, which is imperative in gas-making machines.

Part B contains a fan or blower which draws in the atmospheric air, and discharges the same at any desired pressure through the carburettor fixed inside the tank (A), which becomes impregnated with the vapours of the benzoline, and passes from the carburettor to a specially-constructed governor or regulator (C) as hydrocarbon gas, from which it is drawn for use.

It will be readily understood from the above drawing that the "Helios" stands alone in the simplicity of its construction, while it may be claimed with equal truth that in actual working the oil tank has only to be kept filled to insure its automatic action, without the slightest anxiety to the user. The only gas-producing material necessary, benzoline, is easily obtainable, and a sufficient supply can be put in the tank to last eight days. This is an important feature, for previous machines have defeated the purpose for which they were intended, by specifying some oil to be used that could not readily be procured in small quantities. These drawbacks have no doubt militated against the more general adoption of gas-making machines, and they have hitherto been used only when no other means of lighting were possible. But there is no reason why, under the improved conditions of the Moeller patent, this method of lighting should not compete with gas companies, and even with electric light. The gas produced is 50 per cent. cheaper than ordinary gas in London and of higher candle-power, whilst the advantage of being the proprietor of your own gas, and regulating the consumption of it, by burning any number of lights required, is a matter that should be taken into consideration. The inventor claims that the cost of each machine is saved in twelve months. We have made a careful inspection of the "Helios" in operation, and can fully confirm the merit that is claimed for it. The machine itself can be put in a corner—it needs no attention—and the light produced is remarkably white and brilliant, unaccompanied by smell. An incandescent gas-light burner (Welsbach system) of special pattern has been designed for the "Helios," consisting of three parts—brass part, mantle or incandescent body and globe, no chimney being required, and the result is a light that cannot be excelled.

We are confident the "Helios" will be largely adopted, when its merits are more widely known, for country houses, hotels, public buildings and in every direction where a cheap and efficient light is desired. The coming season will doubtless bring a large demand. We should mention that the Incandescent Gaslight Co., Limited, the proprietors, are prepared to fix the machine in any part of the country and to do all the necessary gasfitting in connection with it, so that efficient workmanship should be secured. Mr. Moeller and the Incandescent Gaslight Co., Limited, are to be congratulated on their most recent enterprise, for which we predict a conspicuous success.

THE RIBBLE SCHEME.

THE final report of the Commission appointed by Parliament to report upon the practicability and probable cost of providing a navigable waterway between Preston and the open sea and other points in connection with the scheme of Ribble development, has appeared. The Commission consisted of Sir George Nares, K.C.B., Sir Charles A. Hartley, K.C.M.G., C.E., and Mr. John Wolfe Barry, C.E. The report first deals with the selection of the best navigable waterway between Preston and the open sea, and next with the costs necessary to secure it. The three courses for the waterway are the north channel, running past St. Anne's-on-Sea, the south channel, past Southport, and the central channel. The Commissioners deal at length with the advantages and disadvantages of the three channels, and suggest the central as the most direct course from Preston to the sea. As to the question of the cost, the Commissioners are not prepared to recommend the whole of the outlay necessary for the immediate construction of the whole of the channel they contemplate. The estimated cost for such a channel is given at what they call the startling sum of 756,000*l.* The Commissioners therefore say that, after mature consideration of all the bearings of the subject, they only venture to recommend the provision of a fixed channel from Lytham to the fourteenth mile, and the cost of this they estimate at 220,000*l.* They consider that the subject of any prolongation should have further consideration when the result of the extension to fourteen miles had been experienced. They leave the recommendations of the interim report as to training walls where they stand, and in the matter of dock equipment they hold that the expenditure should be 18,000*l.*, subject to an increased outlay of 6,500*l.* to provide hydraulic machinery in lieu of hand-gear suggested in the interim report for the opening and closing of the dock gates and sluices, to form roads and sidings round the docks, to provide gas and water supply, and to build a small warehouse. But the additional amount of 6,500*l.* is to be forthcoming from a balance accruing through a certain branch of proposed expenditure falling short of the estimate by that amount. The corporation had asked for 61,000*l.* to be spent in addition, but the Commissioners do not recommend the outlay, on the ground that, although there is hope of a future coal trade, no such trade "has as yet been guaranteed; and although they agree that in order to attract trade proper facilities must be provided, it appears to the Commissioners that the question of what the extent of expenditure on future equipment ought to be is one which should be left to be discussed in Parliament in the light of intermediate events." On the question of control the Commissioners adhere to the opinion, "that when the dock has been opened and trade developed a dock and harbour trust should be constituted." Not the least interesting part of the report deals with the financial and rating considerations. When the borrowing powers are exhausted at the end of the present year the total expenditure will be "over 1,000,000*l.*; and this will mean a rate of 2*s.* 8*d.* in the pound." The original scheme cannot now be completed "without an addition to the capital commitments of the town of 816,000*l.*," meaning a possible maximum rate of 4*s.* 9*d.* in the pound; and in face of this large outlay, and as the best solution of the present difficult situation, they have sanctioned the lesser outlay. This will involve an addition of 8½*d.* to the 2*s.* 8*d.* which will be necessitated by the present capital commitments. The Commissioners say:—"Even if the works are carried out there must still remain many difficulties of navigation for large vessels in a tidal channel sixteen miles in length, and trade has to be attracted to Preston from other docks, and so to be more or less created in the face of natural difficulties."

THE LATE J. WILLET, C.E.

ON Saturday the death occurred in Aberdeen of Mr. John Willet, C.E., a gentleman well known in Scotland as a distinguished member of his profession. The deceased, who was a native of Aitkenhead, Kirkmichael, Perthshire, was educated at Ayr Academy, and afterwards attended classes in the School of Arts, Edinburgh. In 1837 he commenced his professional career by entering as an apprentice the office of Mr. James Thomson, C.E., Glasgow, and at the conclusion of his apprenticeship he became an assistant to Mr. Andrew Thomson, also a civil engineer in Glasgow. Mr. Thomson had much experience in the construction of railways, and Mr. Willet was for a time engaged on the Glasgow and Garnkirk and Pollok and Govan railways. In 1843 Mr. Willet went to Liverpool as an assistant to the famous railway-making firm of Messrs. Locke & Errington, civil engineers, and here he remained till 1851.

Estimates given for Experimental Work of all kinds on application.

That period covered the age of the great railway-making mania, and the deceased was engaged in many different parts of England and Scotland in carrying out the construction of the Grand Junction Railway (between Birmingham and Warrington), the Lancaster and Carlisle Railway, the Harrogate Railway, the London and York Railway, the Runcorn Loop Railway, the Caledonian Railway, the Birkenhead and Manchester Railway, and the Aberdeen Railway. In 1845 Mr. Willet was appointed one of the resident engineers in charge of the construction of the lines authorised by the Caledonian Railway Act of 1845 from Carlisle northwards. In this position he remained till 1849, when he came to Aberdeen, having been appointed resident on the Aberdeen Railway, which was afterwards amalgamated with the Scottish North-Eastern Railway, and he held this appointment and was engaged in general engineering business throughout all the changes and amalgamations that took place down to 1866, when the Scottish North-Eastern was absorbed in the Caledonian. He was thereafter employed by the Caledonian in completing the Denburn Valley, the Dundee and Forfar, and the Newtyle branches, &c. From 1849 to 1869 Mr. Willet was engaged in the construction of the Deeside Railway, in the Alford Valley, Peterhead, and Fraserburgh, and Oldmeldrum Railways; on the Arbroath and Forfar, Waterford and Kilkenny, Fife and Kinross, Montrose and Bervie, Dundee and Forfar, and other railways; at the Perth general terminus, and in the construction of bridges over the Dee and Don. Thus for a period of over thirty years he was, in fact, engaged almost exclusively in the projection of railways. After severing his official connection with the railway, Mr. Willet was engaged in Aberdeen in the general practice of his profession. Besides continuing the construction of railways, or being employed in different capacities in connection therewith—the last projected by him being a line from Brechin to Edzell, for which an Act of Parliament was obtained last year—he constructed a large number of harbours, bridges, waterworks, drainage systems; the harbours including those of Johnshaven, Cruden, Fraserburgh, Sandhaven, Rosehearty, &c.; and the bridges those over the Lossie at Bishopmill, and Inchbroom, Elgin, over the Deveron at Rathiemay and Banff, over Ythan at Kinharrachie, over the Leven at Balloch, and over the Findhorn. His water-supply systems included many of the towns in the north, and the drainage schemes of Montrose, Forfar, Nairn, Brechin, Banff and Inverness were carried out according to his plans. In 1851 he was elected a Fellow of the Royal Scottish Society of Arts; and in December 1852 he was made a member of the Institution of Civil Engineers, London. The deceased is survived by a family of four sons and three daughters, the eldest of whom, Mr. John L. Willett, is an advocate in Aberdeen. Mr. Willet was born in 1815, and was thus in the seventy-sixth year of his age.

PATENTS.

From ½ to 4-Horse Power.

CHEAPEST, SIMPLEST, AND MOST ECONOMICAL GAS MOTOR.

SUITABLE AND USED FOR

Hoisting, Sawing, Printing, Pumping, Grinding, Mining, Chaff Cutting, Polishing, Organ Blowing, Sewing Machines, Dairy Work, Boot Making, Pulverising, Soda Water Machinery, &c., &c., &c.,

AND UNEQUALLED FOR ELECTRIC LIGHTING.

Professor JAMIESON, M.I.C.E., F.R.S., Glasgow, in his Scientific Report, says:—

"Throughout the whole of my electrical test the *Engine* WORKED VERY STEADILY; *in fact I have never before tested a Gas Engine which maintained such uniformity of speed* at full power; *no pulsation or blinking being observable in the incandescent lamps.*"

And Professor KENNEDY, F.R.S., M.I.C.E., University College, London:—

"There is no doubt that it is a most important practical advantage of the 'Griffin' type of Engine, that it can be made to accommodate itself to variations of resistance not only without alteration of mean speed, but also without alteration in the number of explosions per minute, and therefore, without any alteration of steadiness."

MAKERS OF PATENTS & SPECIALTIES,
235 High Holborn, W.C.; 109 Hope Street, Glasgow; and Silens Works, Bradford.
Telegraphic Address: "SILENS, BRADFORD."
Estimates given for Continuous and Special Openers.
CAN DESPATCH ON RECEIPT OF ORDER.
STOCKS ALWAYS ON HAND.

The WILMOS is worked with a rod or endless cord. It is extremely neat, and can be fixed to open either top or bottom, inwards or outwards, no cutting away of frame required. When worked with a rod is most efficient for Public Buildings, as the key can be loose. For Price Lists, Illustrations and Testimonials, write as below. For Continuous and other Lights, Estimates given.

BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our DESIGNS, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, J. H. PICKUP & CO.

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE
LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.
Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.
Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.
Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4s. 6d. and 6s. each. Household and Fancy Filters, from 10s. Water-Testing Apparatus for detecting Impurities in Water, 10s. 6d. and 21s. each.

TRADE NOTES.

NEW Board Schools have been erected at Newport, Mon., and the most careful consideration has been given to the ventilation, which has been carried out by the "Climax" Ventilating Company, of 15 Great George Street, Westminster, their direct-acting turret ventilators being used for the extraction of the vitiated air and fresh air admitted by their improved air-inlets. The "Climax" Ventilating Company have received a letter from Mr. Howell, in which he says, "I have pleasure in certifying that your system of ventilation has given me complete satisfaction, and I shall readily recommend it to others."

THE friends of the late Mr. J. F. Swinburne, J.P., have lately placed a memorial tablet in Acocks Green Church, near Birmingham. The work is carried out in carefully-selected Derbyshire alabaster, and the details are of the most delicate character. The framework is elaborately canopied and crocketted, rising from a richly ornamental mould which serves as the base, while at each side of the tablet proper are canopied niches enclosing figures of angels in full relief. The upper portion is divided into five canopies, the centre one, which is surmounted by a cross, being higher than the others. Immediately under this the arms and crest of the deceased gentleman form a centre for the inscription, which is deeply carved into the surface. The work has been carried out by Messrs. Jones & Willis, of Birmingham and London.

TWELVE clerestory windows are now being completed by Messrs. Charles Bussell, Gibbs & Co., of Wells Street, W., for shipment for the council chamber of the new Municipal Buildings, Bombay. The design is geometrical, with rich borders and foliated ornament in the head, while in the centre are medallions with shields bearing the city arms. The firm has already sent out a large four-light bay window, also for the council chamber; each light is divided by stone mullions with three panels, the heads of which are of rich foliated design, with corresponding borders, and in the centre of the top and bottom panels are medallions with shields bearing heraldic designs, taken from the arms of the Corporation, while in the centre panels are shields with the full city arms and motto, "Urbs primis in Indus," with supporters on either side. In the tracery above the city arms are repeated, the whole forming a very rich window, specially designed for the strong light to which it will be subjected. In addition to this they have also sent a number of small panels, some three thousand of quarry rondel glass for tympani of doors to the various offices in the building, and at present have in hand a large quantity of tracery for towers, arcades and entrances in various rich foliated and heraldic designs.

WITHIN the last few weeks the wood pavement has been removed from the carriageways of King Edward Street, E.C., Billiter Street (part of), Aldgate (part of), and St. James Place, S.W., and these streets are now paved with compressed asphalte, the material used in each case being that of the French Asphalte Company.

THE ratepayers of Skipton have rejected a proposal of the Local Board to apply for power to borrow the sum of 40,000*l.* to carry out a scheme of water supply. This is the second scheme which has now been rejected.

A NEW peal of tubular bells has been erected in the steeple of St. Giles's Cathedral, Edinburgh. The previous peal of these bells, supplied by Messrs. Harrington, Latham & Co., Coventry, were found to be too light for the position in which they were placed in the middle of the city, and this peal, from the works of the same firm, are altogether of a heavier type, and have a deeper note. It consists of thirteen bells, attuned in the key of A flat. The largest tube weighs about 3 cwt., and is 9 feet 3 inches in length and 4¼ inches in diameter. The smallest of the tubes weighs about 70 lbs., and is 5 feet in length and 3 inches in diameter. The largest hammer weighs 12 lbs. and the smallest 7 lbs.

THE new harbour works at Thurso, for which an Act was obtained in 1889, are making good progress. In 1890 a contract was entered into with Mr. Mackay, and by that contract the works have to be finished within two years from November last. These works will include a pier 825 feet in length along

the river, and a retaining wall which will enclose several acres of what is now beach, but which is to be reclaimed. On the opposite or Thurso east side a short wall or groyne will jut into the river, and it is expected that by this means the river, which the contractor has to deepen to the extent of 4 feet at low water in ordinary spring tides, will scour itself. The present is the third attempt that has been made to secure a harbour for the town.

THE Hampstead Vestry has resolved to apply to the Board of Trade for a provisional order authorising it to introduce electric lighting for public and private purposes into the borough of Hampstead.

THE firm of C. Carr, Smethwick, have secured the contract to recast the fourth bell, weight about 8 cwt., and to rehang the whole of the peal of six bells at Old Swinford Church, near Stourbridge.

A LITTLE above Kirkham Abbey stands the beautiful church of Whitwell, near York, which has been further enriched by a clock striking the hours, given by Mrs. Egerton, Whitwell Hall. The clock was made and erected by W. Potts & Sons, of Leeds.

THE electric light is being introduced into the public works in Fife. Messrs. W. Livingstone & Sons, Leslie, have their spinning mills and bleachfields illuminated by the electric current, and preparations are being made by Mr. C. Anderson, of Fettykill, to have his paper mills lighted in the same way. Mr. Anderson has offered to share the benefits of the new light with the villagers.

NOTES ON NOVELTIES.

Domestic Electric Pump.—Messrs. Merryweather & Sons have working at their establishment in Long Acre a small pump, suitable to supplying house-tanks in country districts, where there is neither gravity nor machinery for pumping. It consists of a rotary pump, driven by screw-gearing direct from an electric motor, which is influenced by a primary battery fitted in the cellar. The pump and motor do not weigh more than 25 lbs., and occupy a space of a foot square. It is certainly a novelty, and in its way will throw quite a powerful little jet, equal to a London Brigade hand-pump, for fire extinguishing. Messrs. Merryweather ask us to notify to architects and those generally interested, that they may see the pump in operation at any time.

BUILDING AND BUILDERS.

NEW premises are to be built at Willenhall for the Birmingham and Metropolitan Banking Company. The plans have been prepared by Mr. B. Baker, town surveyor.

AT the meeting of the Glasgow Dean of Guild Court permission was granted to the Scottish Co-operative Wholesale Society, Limited, to erect a warehouse and stores in Crookston Street; to A. G. Marshall, to erect eight tenements of dwelling-houses, four storeys in height, in Westmoreland Street: and to Thomas Hinshelwood & Co., chemical manufacturers, to erect buildings in Glenpark Street.

AT the meeting of the Stafford Board of Guardians the Board had under consideration the proposed new buildings and alterations at the workhouse, to include new infirmary, dining-room, chapel, porter's lodge, &c. A committee had recommended the enlargement as proposed, and also that 4,000*l.* should be borrowed to enable it to be carried out. It was eventually decided that the building of a chapel was unnecessary, and that the necessities of the case would be met by the extension of the dining-room and the erection of a hospital. An enlarged committee was appointed to report on the scheme.

PLANS for building a chapel at Glenboig, in connection with the parish church of New Monkland, have been approved of.

AT a preliminary public meeting held in Stourbridge, a committee was appointed in furtherance of a projected scheme to establish a cottage hospital.

AT the meeting of the Worcester Board of Guardians, the Building and Property Committee presented a report from Messrs. Rowe & Sons, architects, on the proposed school buildings, showing where reductions might be effected in the event of the children of the workhouse being educated in the parochial or Board schools. It was resolved that the modifications in the plan, whereby a reduction will be effected in the cost of the erection of about 1,000*l.*, should be adopted.

PLANS for proposed alterations to the workhouse at Hollingbourne, at a cost of about 1,000*l.*, have been prepared by Mr. F. W. Ruck, county surveyor, Maidstone.

THE work of restoring the parish church, Winfarthing, has been placed in the hands of Mr. Ward, of Diss. The two north windows in the nave are completed, and the workmen are at present engaged on the west window in the south aisle. The

windows are being thoroughly restored, and the defective portions of the mullions, tracings and sills are being replaced.

AT Erith the erection of buildings has been begun for Messrs. Fraser & Chalmers, marine engineers, who are also the proprietors of very extensive works at Chicago. The works when completed will afford employment to a large number of hands.

PLANS prepared by Mr. Morham, city superintendent of works, have been passed by the Edinburgh Dean of Guild Court. It is proposed to utilise the house No. 2, the upper storey to be used as a residence for the superintendent, and the lower part altered to suit the requirements of the station itself. The lower storey is to have a new front. It will be ornamental in character, cut into bays by rusticated pilasters, and having its doorways and windows circular-headed, with moulded archivolts. The cost is estimated at 2,500*l.*

IT has been decided that Mr. John Murdoch, C.E., Ayr, should carry out the work of building a new river wall in South Harbour Street, Ayr. The wall will extend from the New Bridge to a point opposite the Queen's Hotel.

THE newly built tower of a church at Pörtschach, on the shores of the Wörther See, in Carinthia, on Sunday fell with a crash.

SEWAGE DISPOSAL.

IN the Chemical Section of the meeting of the British Association at Cardiff, Mr. C. G. Moor read a paper on "A New Method for the Disposal of Sewage, with some references to schemes now in use." The author remarked that at the recent Congress on Hygiene and Demography, Dr. Thresh asked, with reference to sewage treatment, if any of the processes mentioned enabled them to get rid of their sewage in such a way as to give rise to no nuisance and cause no danger to health, at a cost sufficiently reasonable, considering the importance of attaining such results. In the opinion of most experts of the present day the only answer was a direct negative. That could be seen from a brief consideration of the methods now in use—lime processes, other than lime processes, and irrigation. In the first of the three a good effluent was the only thing aimed at, as the sludge was worthless. In the second, the sewage matter was precipitated by various preparations, and the deposit of sludge was often of some value as manure, whilst there was also an electrical treatment. With regard to irrigation, that might be adopted with success where land was suitable and cheap, but it was a disputed point as to whether parasites might not be communicated to the animals feeding from the crops raised off unfiltered sewage, and it was certainly not advisable to irrigate fields with untreated sewage so that pools of putrifying matter were formed, round which cattle were feeding. The treatment referred to in the title of the paper had been practically tested at experimental works at Leyton. He had no very novel suggestions as to the precipitation of sewage, the originality of his method depending on the manner in which the sludge cake, produced by any precipitation process, might be converted into marketable products. Sludge cake consisted, roughly speaking, of 25 parts water; 20 parts inorganic matter, containing phosphates; and 55 parts combustible matter, containing nitrogen. If they could afford to distil the coke in gas-retorts they would save the ammonia, but it would not pay to do that unless it was very rich in ammonia, and then it would be saleable without further treatment. There was, however, a cheaper way of distillation in a patent obtained some years ago by Mr. Rees Reece, in which a kind of lime-kiln with a forced draught, connected with a series of condensers, was used. He had used the same method and had experimented on a sufficiently large scale to show the possibility of practical working. The sludge gave ample heat for its own distillation, and might also be used to raise steam in the same furnace if desired. Eighty per cent. of ammonia was what he actually obtained, and probably more could be obtained with better apparatus. The low value of the ash, which contained about 60 per cent. of calcinna salts, was due to the addition of the lime for precipitation and pressing. The lime also produced clinkers in the furnace when at the temperature at which point inflammable gas is produced. Where clinkers could be used that might be done, and the ammonia alone relied on as a source of income. The uncondensed gases, having an unpleasant smell, must be burnt to avoid a nuisance. What was wanted was to produce a sludge cake rich in ammonia and phosphate, without adding precipitants in such a quantity as to lower the percentage of phosphate in the ash. The use of lime ought to be avoided at all costs, and he should be inclined to try carbonised sludge in powder mixed with salts of alumina and iron, and after precipitation running the liquid through a bed of lumps of carbonised sludge, which could be burnt when foul. It seemed probable that by using a sufficient quantity of that carbonaceous material (which could be so

readily renewed) a considerable degree of purity could be arrived at in the effluent. At the present day it was fast becoming widely felt that it was the duty of towns to treat their sewage in some way so that no injury might be caused to health, but yet they ought not to rest content with processes that yielded nothing but refuse. It was now many years since Liebig insisted on the need of maintaining a proper circulation of phosphates and ammonia if they wished their land to remain fertile, and that need, instead of diminishing, showed itself more clearly every day.

NEW CATALOGUES.

WE have received from Messrs. T. & R. Boote, of Burslem, their catalogue for 1891 which has just been issued. The catalogue illustrates in colour the tiles for floors, the tiles for walls manufactured by Messrs. T. & R. Boote, and in addition hearth titles and also glazed dado and wall-tiling. The patterns, besides showing the colour, have the advantage of being shown as portions of flooring, walling, &c., complete with border, from which a good judgment can be formed of the appearance of the tiling *en masse*. Rich and effective floors will be found in consulting plates Nos. 102, 103 and 104, the new colours and combinations being very pleasing. Nos. 608 and 609 on Plate 100 will be likely to find favour, while the treatment and colouring is quite original. They are singularly inexpensive. About twenty-five plates, each containing several designs, are included in the catalogue, the scale adopted being from $\frac{3}{4}$ inch and 1 inch to a foot. Among so many designs for tilework it is rare the standard of excellence in design and colouring is so well sustained from first to last. In some introductory and explanatory remarks Messrs. Boote state that in ordering tiles from the book it is necessary only to mention the number of the pattern, and they particularly request that the book be not mutilated, as any single sheet required will be supplied on application. Special designs also will be prepared if necessary or when desired, in order to meet any particular requirement of a purchaser. Estimates for tiles fixed complete are furnished if required, but to be done satisfactorily a plan of floor should be sent, with accurate measurements marked in figures in preference to being drawn to scale. Another point which it is always well to bear in mind in these days is that when clients intend to give an order to a manufacturer they should, as far as possible, give ample time to insure the satisfactory completion of the order.

THE great revolution that has taken place during the last twenty or thirty years in the improved construction of open fireplaces, is strikingly shown in the illustrated price-list of slow combustion stoves manufactured by Messrs. Barnard, Bishop & Barnards, Limited, of the Norfolk Iron Works, Norwich. During these past years attention has been called by professional men and experts on many occasions to the old-fashioned mode of burning coal as a system wasteful of fuel and also of heat, and which is likewise fruitful in the production of the smoke which contaminates the air of our towns, and which, except when all circumstances are favourable, often finds its way to the outside of the house through other outlets than the chimney. Thanks to the slow combustion stoves, no one need now suffer from smoky chimneys. These stoves, as should be well known by this time, consume fuel on a most economical scale, the combustion being what is called slow, but which, strictly speaking, is a natural or normal condition of combustion in place of the old style, which is better named conflagration of fuel. It also follows that there is comparatively little smoke emitted; the whole of the heat capable of extraction is developed and utilised, and a perfect consumption of fuel effected. Any persons who have tried these stoves will doubtless agree that Messrs. Barnard, Bishop & Barnards are warranted in claiming the advantages they enumerate for their slow combustion stoves. Among these advantages it may be stated that the fire once alight can be left to itself for hours, the stoves maintain an equable temperature without producing stuffiness, and coal of any kind, anthracite, coke, wood or peat can be used in them. Over a hundred pages are devoted to the stoves, which are of all kinds, sizes and styles, to suit all purposes and all requirements. In addition, great attention has been devoted to production of an artistic framework for the house fires, whether looked for in the illustrations of the unfixed stove, or in those which show also mantel and overmantel complete. It is needless to say that the most elaborate stove is only more valuable than the plainest in regard of cost of production, the real worth of any one being in the efficiency and other virtues that secure cleanliness, healthfulness, &c. We shall not attempt to refer in detail to the varieties shown in the catalogue. The latest novelties among them, however, are the Osborne and the Norfolk patent stove. The Osborne has been introduced as an improvement upon the slow combustion stove now so well known to the public. The firebrick projecting into the room acts as a great radiator of heat. The fire always burns brightly in this arrangement, the small quantity of ashes

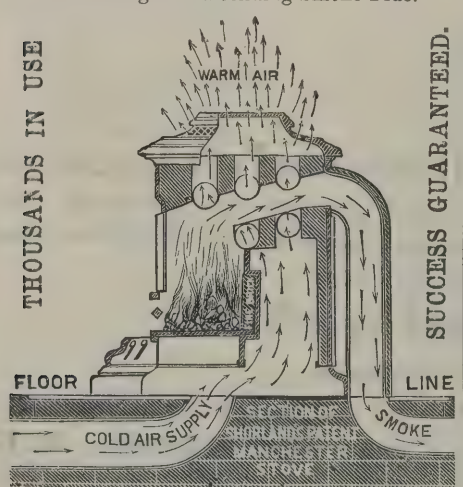
LONDON, E.C.

PATENT No. 2496. A.D. 1884.

dropping on the brick, from which it is easily removed or replaced upon the fire. It is also specially adapted for use in hospitals, sick rooms, &c., and will supply a want long felt by attendants on invalids, the projecting brick enabling any utensil to be kept at any required temperature, for use at any time, and such utensil can be left without fear of contents boiling away, or being spoiled through too great a heat. The Norfolk stove is constructed on slow combustion principles, but is so arranged that air can be admitted from below if a more rapid combustion is required. It is also provided with a patent arrangement for consuming as far as possible the smoke it produces. On referring to the catalogue, it will be seen by the illustration to have a perforated firebrick bottom. This is encased in an iron tray, and is provided with a "hit-and-miss" ventilator, by means of which the draught can be regulated. A novel patent arrangement of fluted and circular back bricks project into and overhang the fire. The back firebrick is made in two parts, a lower vertical portion and an upper projecting part. It becomes highly heated, and consumes the greater portion of the smoke which would otherwise escape by the chimney. The side bricks are placed at an angle, and are so arranged that the whole of the heat is radiated into the room. For the rest, we must leave our readers to glance over the catalogue for themselves, in surety that they will find what will suit their purpose, practically and also artistically. Regarded alone as ornamental metalwork, the higher class stoves will give every satisfaction, while those who require tile decoration will do well to consult the supplementary list of ornamental tiles stocked by Messrs. Barnard, Bishop & Barnards for the decorative treatment of the stoves.

MUNICIPAL WORK IN BIRMINGHAM.

THE report of the city surveyor, Mr. W. S. Till, upon the work of his department states that the length of public sewers constructed in accordance with the general system, either in declared highways or underneath private lands, up to December 31, 1889, was 202 miles 5 furlongs 98 yards. The length of sewers constructed by the Council between January 1, 1890, and March 31, 1891, was 1 mile 3 furlongs 216 yards, which, after deducting a small length for sewers taken up in Duchess Road and part of Latimer Street South, make the total length under charge of the Council on March 31 last 207 miles 1 furlong 207 yards. After considerable negotiation with the Smethwick authorities it has been arranged that for the period of twelve months from March 25, 1891, they shall pay the Corporation after the rate of 3*d.* per head per annum of the population of one-half of the district to be drained through the city sewers, and from March 25, 1892, the same rate shall be paid in respect of the whole area to be drained through the said sewers. The number of private drains laid into the sewers between December 31, 1890, and March 31, 1891, was 580.



The manager of the sewage farm reports that during the fifteen months ending March 31 last the quantity of mud intercepted in the subsiding tanks at Saltley was 267,101 cubic yards, of which 250,878 cubic yards were in the roughing and 16,223 cubic yards in the smaller tanks, giving an average of 587 cubic yards per day, as against 396 cubic yards per day in 1889, and that the quantity of land used for digging in the mud was 59 acres, against 41¼ acres in 1889, whilst the quantity of lime used for precipitating purposes was 4,268½ tons, or an average of 9 tons 7 cwt. 2½ qrs. per day.

During the period covered by the report wood pavement was substituted for macadam in Temple Row, Temple Row West, the Minories, Saint Martin's Lane, in that part of Corporation Street lying between Newton Street and Lancaster Street, parts of Stephenson Street, John Bright Street, Station Street, Hurst Street, Rea Street South and Floodgate Street, and an agreement has been entered into with the Improved Wood Pavement Company as to the maintenance of such pavements. Granite pavement has also been substituted for macadam in Great Barr Street between Montague Street and Lawley Street, Watery Lane, Pitney Street, Macdonald Street, Mill Street, Loveday Street, and parts of Floodgate Street, Rea Street, Rea Street South, Hurst Street, Lower Hurst Street and Spring Hill. Considerable quantities of new flagging have been substituted for old, as also of other footway pavements. The length of declared highways in 1889 was 196 miles 4 furlongs 174 yards. The length of streets declared highways from January 1, 1890, to March 31, 1891, was 3 miles 3 furlongs 212 yards. The total length of streets and roads in the city is now 205 miles 83 yards.

No new tramways have been constructed, but on July 16 1890, the Bristol Road route was again inspected by the Board of Trade, and opened for traffic with electric accumulator cars on the 24th of that month. As the tramway in Navigation Street had been laid without Parliamentary powers, the company, after using the same for a time, were advised that there were serious

objections to their carrying passengers over it, and therefore, with the consent of the Public Works Committee, they are promoting a provisional order in the current session to authorise its use for public traffic. Pending the passage of this order, the committee agreed to a short extension of the lines in Suffolk Street, between Navigation Street and Allport Street, with a cross-over road, which could be used as a terminus, until such time as the lines in Navigation Street could be legally used for traffic. The construction of this extension in Suffolk Street was commenced in December and opened for regular use on February 18 last. The cost of repairs and maintenance of tramway routes has been rapidly increasing, and for 1890 the sums were:—Aston, 919*l.* 19*s.*; Midland, 830*l.* 1*s.* 10*d.*; Central, 5,022*l.* 3*s.* 5*d.*; Western districts, 15*l.* 8*s.* The stone purchased for repairing the macadamised carriage-ways from January 1, 1890, to March 31, 1891, amounted to 23,498 tons, in addition to 11,912 cubic yards of gravel pebbles and grit. The quantity of water used on the roads and in flushing sewers during the year 1890 and the first quarter of 1891 was 173,656 loads, or 59,711,250 gallons; 14,176,980 gallons included in the above were used for flushing sewers. This quantity is nearly double that used in 1889 for the same purpose, and is 7,886,916 gallons above the average of the preceding five years, and is at the rate of 45,585 gallons for every working day during the year. The total quantity used in 1890 was 7,214,920 gallons more than in 1889, and 7,006,820 gallons above the preceding five years' average. Three new flushing machines, holding respectively 330, 450 and 1,800 gallons, have been added to plant during 1890. The total number of lamps under the control of the Public Works Committee on March 31, 1891, was 7,558, and the cost of maintaining the same for the preceding fifteen months was 16,370*l.* 9*s.* 10*d.* In accordance with the instructions of the Council, some progress has been made in the matter of the lighting of the courts. The necessary plans, estimates and provisional apportionments have been prepared, and the notices served on the owners of some 440 courts requiring them to provide the means of lighting. The number of lamps in courts lighted, cleaned and extinguished by the department is 361. The number of horses belonging to the Public Works and Health Departments on March 31, 1891, was —Public Works, 93, valued at 3,951*l.*, and Health Department, 154, valued at 6,217*l.* The number of men employed in the Public Works Department on March 31 last was as under:—Officers (clerks, surveyors, &c.), 29; repairing, cleansing, paving, flagging, &c., streets and roads, 419; stone-breaking, 60; flushing, cleansing and repairing sewers, 34; repairing carts and tools, painting, &c., 11; lighting, &c., public lamps, 172; stablemen, 33; total, 758.

SLOW-BURNING CONSTRUCTION.

The following instructions have been issued by the Continental Fire Insurance Company of New York.

Walls.—The walls must be of the best construction, of standard thickness, as specified below, and not reduced by flues or for any other purpose. The walls must be corbelled out to receive the floor, unless a ledge is made by reason of the wall receding to a smaller dimension. Thickness of walls must be as follows:—The upper two storeys next to the roof, 13 inches; the next two below, 18 inches; the next two below, 22 inches; the next two below, 26 inches; the next two below, 30 inches. Party-walls must be 4 inches thicker than the above on all storeys except the storey next to the roof, or be ledged or be corbelled. Parapet or fire-walls to pass at least 24 inches above the roof. Walls over 100 feet in length must be 4 inches thicker than the standard thickness, unless there are cross-walls of equal height, or solid buttresses with a section area of 300 or more square inches, placed not more than 18 feet apart and extending to the top of the wall. Flues, if any, must have walls not less than 8 inches thick, well laid in mortar and pointed and of sufficient area for the service required. No beam or woodwork to enter the wall within 18 inches of the interior of any flue. Chimney-tops must not be less than 4 feet above the roof.

N.B.—Unless the sand used in making mortar is good sharp sand, cement mortar should be used. This is very necessary in many sections of the country where both sand and bricks are of inferior quality. Cement mortar is, of course, preferable in any section and under any circumstances.

Columns, Girders and Beams.—The wooden columns, girders and beams should be of such dimensions as to easily bear their respective strains after allowing 1½ inches for charring on all exposed sides, but in no case shall any one of their dimensions be less than 8 inches. They must be planed smooth on all surfaces which may be exposed to action by fire. Bore the cores of the columns one and one-half in diameter, and ventilate near the top and bottom by half-inch hole transversely through the column. Special provisions must be made at points which are liable to dry rot, to secure ventilation

VOLUME XLV. OF THE ARCHITECT.
Handsomely bound in loth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

around the timbers. Beams, if of wood, should not be bolted through the walls but rest upon a plate in the wall, on the upper side of which is a transverse fin which fits into a groove across the under side of the beam, and firmly secured to it by wedges; the upper edge of the beam at the end should be rounded. Iron columns, girders and beams, where exposed, must be encased in a fireproof covering of terra-cotta or fire-clay. Wrought-iron, being more liable to rust than cast-iron, should not be covered with plaster of Paris or cement. Lime mortar will not rust the iron.

Floors.—Floors must be laid directly on the beams and girders without joists, and be of the following construction:—The under or heavy floor plank must be planed on the exposed surfaces, splined or tongued and grooved, and not less than the following dimensions:—For bays of 8 feet or under, 3 inches; bays of 10 feet or exceeding 8, 4 inches; bays 12 feet or exceeding 10, 6 inches; for bays over 12 feet, 8 inches in thickness; for long bays it is recommended that the floors be made of plank on edge fastened closely together, but no bay must be over 15 feet. The floors must be made waterproof by some approved material laid between the top and under flooring. If paper is used there must be a double thickness of rosin sized paper or roofing felt. Top floor to be hard wood, at least $\frac{7}{8}$ inch thick, tongued and grooved. All joints between the walls, columns and floors must be caulked or provided with some approved waterproof joint. The best construction requires a slight inclination of the floors to the water vents, which must be provided on all floors where the water can be carried either through the walls or down into drains. Openings in the floor for steam or other pipes must be protected by a section of larger pipe made watertight in the floor, and extending 3 inches above it. If it is necessary to make holes in the floors for belts or shafts, metal jackets must be carried through the floor extending 3 inches above it and be watertight.

Bulkheads.—Bulkheads must be constructed of heavy plank not less than 3 inches in thickness, and planed on all exposed surfaces.

Roof.—The roof must be constructed of heavy plank tongued and grooved or splined, and not less than 3 inches thick and dressed on the other side. Covered externally with metal, composition, slate, or tile. Openings, if any, to be standard.

Cornice.—Cornices must be of brick, stone, terra-cotta, or metal on metal brackets, bolted into the walls. There shall be no openings into the building or attachments to wood or ends of timbers.

Stairways and Elevators.—Stairways and elevators must be placed in a brick shaft, the walls of which must extend at least 24 inches above the roof of the building, and all openings into it must be protected by standard fire-doors, and have sills 3 inches above the floor. In cases where stairways cannot be placed in a brick shaft, or where they do not run through all the floors, they must be constructed as follows:—The entire stairway must be of incombustible material; at some portion of the stairway between each floor a standard fire-door must be provided, which shall be furnished with some self-closing device, and the portion above or below said door must be rendered air-tight by being closed in by brick, terra-cotta, concrete, or iron frame, with metal lathing plastered on both sides. The floor must be raised 3 inches around the head of such stairway to prevent water from going down the stairway.

Interior Finish.—All walls and partitions to be brick, tile, terra-cotta, or iron frame with iron lath and plastered. No wooden lath or furring will be allowed. Where wainscoting is used no hollow space is to be left behind it. Woodwork should not be painted or varnished. Fireproof paint for the underside of the floors and other woodwork may be used, but it is preferable not to paint the heavy woodwork until it has been up for some time.

Exterior Openings.—All openings exposed by other buildings within 40 feet must be covered above the first floor with standard shutters; when exposed by a special within 15 feet, the openings on first floor must also be provided with shutters. A standard fire-door or shutter for protecting openings as required should be constructed of pine or other soft wood (hard wood should never be used, as the charcoal of soft wood holds the nails better than that of hard wood) of two thicknesses of matched boards, at right angles to each other, or crossing diagonally, securely covered with IC tin, 14 by 20, on both sides and edges, with folded lap-joints, the nails for fastening the same being driven inside the lap. The hinges, bolts and latches should be secured or fastened to the door or shutter after the same has been covered with the tin. Sheet-iron should not be used as it is too heavy to allow of the lap or folded joint. In covering the woodwork the tin should be placed round the edge and folded down at the top and bottom of the side of the door, making a mitre in the folding. In a room having an atmosphere liable to rust the tin, "leaded" sheets should be used instead of "tinned" sheets. Instead of closing by hinges

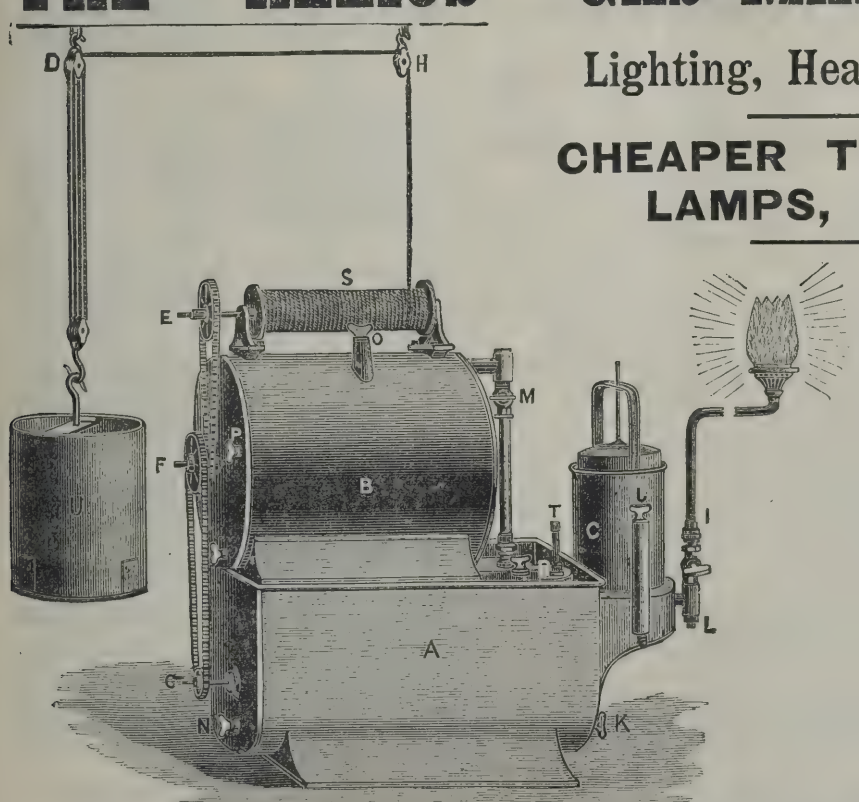
and latches, doors are preferably arranged so as to run on inclined slides placed overhead, the doors being suspended on each slide by means of suitable iron pulleys or trolleys. The pitch of the rails should be about 1½ inches to the foot. They may be secured open by a fusible metal link, which would yield to a rising temperature and close the door automatically, and should be about 3 inches larger than the opening covered, on all sides. Care should be taken to make them tight at the bottom, where there should be an iron or stone sill sufficiently close to the bottom of the door to prevent the passage of flame. If hinged doors are used they should shut into a rabbet in the masonry or into an iron frame rabbet, or may have a 3-inch lap outside of the opening in the wall. When the frame is of wood it should be as securely covered with tin as the door itself.

HULL VICTORIA CHILDRENS' HOSPITAL.

THE Victoria Hospital for poor sick children, of which we give a sketch, is situated in Park Street, Hull, and was opened on Wednesday, July 22, by the Marchioness of Salisbury. The principal entrance is from Park Street, and it opens into a spacious approach to the vestibule, on the right of which are the board and the matron's rooms, while on the left is a suite of rooms for the use of the house-surgeon. A glazed door on the west side leads to the corridor connecting the official department with the hospital proper and thence to garden entrance and suitable lavatory accommodation. The hall is well lighted, and there is direct communication with the convalescent room (37 feet by 16 feet), the matron's stores and the nurses' retiring-rooms. On the ground-floor a little distance to the rear of the building is the kitchen, with stores, scullery and servants' sitting-rooms. A noticeable feature is the disconnection of the laundry from the main building. Access is gained to it by a covered passage, through the kitchen department, from which also runs the staircase to the isolation ward. Ascending to the first-floor by a handsome stone staircase from the hall the principal ward (50 feet by 22 feet) is reached, containing sixteen beds, and having in close proximity bath-rooms, nurses' duty-room (with an inspection-window to the ward), service-hoist and linen store. Immediately at the head of the staircase are the matron's and nurses' sleeping apartments, and on the same landing the matron's office, central in its position, to allow of effectual supervision being exercised. Crossing the landing two wards facing Park Street are reached, one of which contains six beds and the other twelve, and which are separated by a nurses' duty-room, having the usual inspection-windows. A bath-room and linen-store are also placed near at hand. The ward on the second floor has accommodation for sixteen children, and possesses adjuncts similar in every respect to the ward below. Directly opposite is the lobby, by which access is gained to the ward for patients who may need to undergo operations, and close by is the operating-room, exceptionally well-lighted by side and top-lights. On this floor also is the isolation ward, but it is approached only from the ground floor by an enclosed stone staircase at the west end of the main



building, opening from the covered passage already alluded to. This ward has four beds, with bathroom and nurses' accommodation. All the wards have cleanly floors of pitch-pine, walls finished with Parian cement, and windows glazed with plate-glass. The two large ones are heated with central stoves with descending flues, the smaller being supplied by hygiastic grates. Beyond this, a supplementary system of hot-water pipes has been laid down for use in extreme weather, so that there will be little difficulty in keeping up an equal temperature. From Clarendon Street the outdoor department (which constitutes an entirely separate building) is approached. Here, as elsewhere, the arrangements are excellent. Consulting, examination and waiting-rooms, and a covered space for the perambulators, are conveniently arranged, while to the north of these the dispensary and drug-stores are situated, where also the greater part of the

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

14 PALMER STREET, WESTMINSTER, LONDON.

dispensing for the hospital wards will be done. This block, by the way, has a frontage of red brick and Ancaster stone dressings after the style of the Park Street elevation. In the rear are the post-mortem-room and mortuary. The Park Street elevation is in Gothic style, of an early French character, also built of red stock bricks and Ancaster stone dressings. The main building is, however, carried out in the plainest manner, with the strictest regard for economy. Mr. W. H. Bingley, Hull, with the late Mr. Musgrave, prepared the plan, under whose personal supervision the work has been carried out. Its total cost, including furnishing, is estimated at 7,500*l.* Messrs. George Jackson & Son, Hull, have been the contractors for the entire work, and Mr. J. Halcrow was engaged as clerk of works. The sub-contractors were Messrs. Dawber & Sons, slaters; Mr. G. Taylor, plumber; Mr. Watkin, painter; Messrs. Bradford & Co., Manchester, kitchen and laundry arrangements; and Messrs. King & Co., ironmongers.

THE PATENT SYSTEM.

A PAPER was read at the meeting of the British Association, on the 22nd inst., by Mr. Lewis Edmunds, D.Sc., on "The Taxation of Inventors." He said:—There are few classes of the community, in a manufacturing and industrial country like Great Britain, to whom the nation at large is more indebted for its prosperity than the inventors. It would, therefore, appear to be to the interest of the Government to offer every facility and encouragement to inventors, and with this object to afford them full opportunity for the acquisition and retention of property in their discoveries. But the contrary is the fact. There is no species of property which is so heavily pressed upon or so burdened with taxes as the very limited one which the law allows an inventor to acquire. Although distinctions may be drawn, the monopoly granted by a patent is in many respects of the same character as the copyright acquired by an author, and the word "copyright" might be almost equally well applied to the rights acquired by an author and by an inventor. But while the properties of an author and an inventor are very similar in their nature, the position of an author is immensely superior. He or his representatives hold the copyright for life and seven years after, or for forty-two years from the date of publication, whichever may be the longer term; and no fees of any kind are payable to the Government, except when for the purpose of securing rights in foreign countries, or of taking legal proceedings for an infringement, it is necessary to register the copyright at Stationers' Hall, in which case a small fee is demanded. There is no special taxation of authors of any kind, unless, indeed, we count as such the five copies which have to be presented to the British Museum and the University libraries, and this is a small matter. But an inventor is not so fortunate. By the nature of the case, he can only secure himself after complying with numerous formalities and making a full disclosure of what his invention is. This, of course, cannot be complained of. But even then the inventor obtains the monopoly of his invention for fourteen years only, and this is now subject, after the first four years of the term, to the payment of heavy annual fees, ranging from 10*l.* to 20*l.*, and amounting to 150*l.* in all. It is contended that these renewal fees are an unjustifiable tax upon inventors, and also that the preliminary fees payable at the Patent Office in connection with the application for the grant of the patent and the lodging of the specifications being 4*l.*, and quite sufficient to cover the whole of the office expenses, no further demand ought to be made by the Treasury. If it were proposed to put a tax of 10*l.* or more a year on every literary work, or else to abolish the copyright of the author, the suggestion would be scouted; yet inventors, with every claim to equality of treatment, are mulcted of these heavy fees or else lose their patent right. Under the recent Patents Act of 1883, the total expense of a patent running for the full term of fourteen years was reduced from 175*l.* to 154*l.*, but the whole abatement took place in the initial expenses, which were reduced from 25*l.* to 4*l.* What are now called "renewal fees" to the amount of 150*l.* are payable as before, either in amounts of 50*l.* and 100*l.* before the end of the fourth and eighth years, or in annual payments in the fourth and succeeding years varying from 10*l.* to 20*l.* As a matter of fact, the patentees, with few exceptions, elect to make the annual payments in preference to the lump sums of 50*l.* and 100*l.* In the United States of America inventors are not discouraged as they are here. There a patent may be obtained, which lasts for seventeen years, for a payment of about 7*l.* 10*s.* in the first instance, and no further fees of any kind are payable. A British patent which runs for fourteen years, therefore, costs more than twenty times as much as a United States patent which endures for seventeen years. Consequently, although there is a search as to novelty which weeds out a large proportion, there are twice as many patents issued in the States as there are in England, with corresponding advantages to the industries of that country. The patenting of not only home, but also foreign, inventions is thereby encouraged,

and an inventor, having obtained a patent, is induced to push his invention, and to make further improvements in it. The success of an invention means the improvement or creation of some new industry, and hence the country shares with the patentee in the profits of the invention. Looking to the report of the Comptroller-General of Patents in this country for the year 1889, it appears that the total income from fees on patents was 151,794*l.* 4*s.* 4*d.*, of which sum 93,205*l.* was paid by way of renewal fees. The surplus profit of the office was a little more than this sum—namely, 93,534*l.* 8*s.* 9*d.*—and this went to the Treasury, and was used for the general purposes of government. It follows that if the annual taxes were abolished the Patent Office could still pay its way. This surplus profit is, therefore, a direct tax upon the inventors. The taxation of inventors through the medium of "renewal fees" is a remnant of the old demands and perquisites incident to the passing of letters patent under the Great Seal. It is entirely inequitable in principle, it works great injustice and hardship in practice, and, by damaging the value of property in inventions, acts as a drag upon the inventive genius of the nation, and thereby injuriously affects all the industries of the country.

Sir F. Bramwell said he could not agree with the author that the United States system of patents compared favourably with the English system. Those who took a leading part in framing the Act of 1883 well considered the mode by which the poor working man should be enabled to obtain a patent at a price which should not be beyond his means. It was thought that the best way of attaining this end would be to have a very small initial fee, giving provisional protection for a certain period. This system placed the comparatively poor man in a better position than in the case where a heavier charge was made in the first instance. A patent, however, might be so bad that it was not worth the while of any one to take it up, and yet it might contain a discovery of such a character as to prevent any one from using an improvement. In these cases it was contrary to the interests of the community that such patents should exist, because they were not good enough to be worked, and they might be an obstacle to improvement. He urged that it was the duty of those who managed the Patent Office to see that before the statement was allowed to go forth of a surplus being in hand all the expenses incident to a well-conducted office were properly provided for. He was sorry to say that was not the case here. The way in which the specifications were offered to public companies was a disgrace. The type had become crowded and inconvenient, almost illegible; the margin was so reduced as to prevent comments being jotted down; and the engravings, instead of being of the dimensions filed, were sent out reduced by lithography of the worst character. In many cases one was compelled to refer to the original drawing. He advocated a more liberal expenditure of money in the Patent Office. As a matter of expediency the money should be spent in such a way as would give to the public specifications in the clearest and most intelligible form.

Mr. Edmunds summed up, and defended the Patent Office against the criticism applied to the manner in which it dealt with specifications. These were so bulky and numerous as to render it exceedingly difficult for adequate storage room to be found for them.

PORTLAND CEMENT.

THE paper which Mr. Henry Faija read at the meeting of the British Association at Cardiff treated of some of the peculiarities to be observed in Portland cements, and on the most advanced methods for determining their constructive values. After dealing with the manufacture of Portland cement and the materials from which it is manufactured, the author proceeded to describe in detail the proportions of lime, silica and alumina which would constitute an ordinary Portland cement, and explained that their degree of chemical affinity materially affects the quality of the cement produced. With respect to the setting properties of a cement, the speaker explained that there were two periods which might with advantage be noted when carrying out a test; the one being the "initial set," or, in other words, the time which elapsed between the addition of water to the cement and its commencing to set, and the time when it was "set hard"; the time of "initial set" being considered the most important, as it represented the commencement of an actual chemical process, and that any disturbance of the cement after the setting or crystallisation had commenced would detract from its ultimate strength, whereas the time of "set hard" was only a somewhat undefinable period, and really indicated no change in the chemical process, being only one step towards the ultimate hardness and strength which the cement would attain. The test, however, which the speaker considered the most important was that by which its "soundness," or freedom from expansion or contraction, was determined, and he explained that no matter in what time the cement set, to what fineness it was ground, or what tensile strength it

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

developed within the limited period of an ordinary test, could possibly be of any value if the cement proved an unsound one, and that in the course of time it would "blow" and destroy the work of which it was a component. The method of determining the soundness of a cement, which the speaker devised some ten years ago, was explained. It consists in submitting a freshly-made pat to a moist atmosphere of about 100 deg. F., and when set hard immersing it for some hours in water at a temperature of 115 deg. F. This treatment, he said, greatly expedites the set and hardening of a cement, and in like manner develops any blowing tendency which may exist in it, and consequently in the short time of twenty-four hours the "soundness" or "unsoundness" of a cement may be absolutely determined.

A CHANNEL TUBULAR RAILWAY.

THE Mechanical Science Section of the meeting of the British Association was crowded when Sir E. J. Reed, M.P., read a description of the proposed "Channel Tubular Railway." He said :—

The sea in the Channel is everywhere of very moderate depth, and where the bottom is not practically level, its departures from the level are surprisingly small and gradual. The cliffs between Dover and Folkestone are in places 450 feet high above low water ; but the depth of the Channel nowhere reaches 200 feet upon my selected line from England to France. For several miles out from the English coast it is not 100 feet deep ; and the greatest depth, roughly speaking, is about two-thirds of the way across to France, and there its maximum is below 200 feet deep, viz. 186 feet. Now, the gradient of the Severn Tunnel on the Welsh side is 1 in 80, and therefore the Channel bed on the line in question has nowhere a gradient of even one-half as much as that of the Severn Tunnel. I am not, of course, dealing here with minor inequalities, but with the general level and slopes of the natural bed of the Channel at the part where I propose to cross it, viz. from a point between Dover and Folkestone to a point just to the south of Cape Grisnez. Proceeding, Sir Edward gave a detailed description of the levels of the sea-bed between France and England at this part, and said :—We have an almost level stretch of ground of over twenty miles in length to be traversed by a railway, and a proposition which I will submit to you is that, were this a dry valley with no water in it, no mortal man would ever dream of tunnelling underneath it in order to construct a railway, nor would anyone be so insane as to propose to build a viaduct or series of bridges 500 feet high across it. The railway would, of course, be laid along the ground as it is laid over any other stretch of level country.

But the sea overspreads this almost level tract of ground, and its presence has to be taken into account. The question arises, what difference does this presence of the water make in the problem? I answer, it imposes three obligations upon us :—1. We must make the railway a closed-in, instead of an open, road. 2. As the water is tidal, and continually in more or less movement, we have to secure it in position. 3. We have to give it special ventilation, or, otherwise, to provide that the air within it is kept as pure as is necessary. These three objects accomplished, a railway across this piece of submarine ground is as good as any other railway. Now, all these three objects are provided for in the Channel Tubular Railway. The fact that it is a railroad within a perfectly watertight and durable tube, or, as it is, in fact, a pair of tubes, for I have a tube for each line of railroad, completely renders the presence of the sea-water outside of it of no consequence. The securing of these tubes in place, and the ventilation of them, bring me to the details of the system.

I would here point out, however, that the necessity which drives us to the use of water-tight tubes for our purpose is attended incidentally by enormous advantages. With our immense iron and steel resources, it is natural, of course, that we should make our tubes of iron or steel, in so far as the primary and essential elements of their structure are concerned ; and this at once, and obviously, relieves us almost entirely, if not altogether, of the cost, the difficulty, the delay and the danger of doing our construction work at the bottom of the sea. As a matter of fact, with a view to their due weight, durability and economy, I practically imbed the steel structure of the tubes in good Portland cement concrete, thus converting the tubes into stone tubes, which derive their structural strength from imbedded steel framing and plating. These tubes can be perfectly well built by our shipbuilders and engineers, and partly by those of France, just as ships are built, but with much greater economy. All we have to do is afterwards to tow them to their places, sink them, connect them, and secure them. The adoption of this tubular railway, with several hundreds of thousands of tons of steel structures, will therefore be a great blessing to our steel manufacturers and to our shipbuilders and engineers.

The tubes thus made will be towed by steamers from the building ports to the Channel as they are required for being laid in place, and the operation of laying them is one which has been very carefully studied and worked out in order to make it safe and certain. To this end I have devised the system of making the length of tube which has last been laid the means and the instrument of bringing the next length into its position with unerring accuracy. There are those who believe that these successive tubes might be lowered into their places from ships with sufficient accuracy and safety. I doubt that, and I do not trust to it. I have no great faith in the minute adjustment of submarine works by means of ships exposed to wind and tide and in themselves more or less unwieldy. I should be afraid to lower these large tubes separately, and run the risk of striking and injuring one against another. I immensely prefer to make each of these great strong tubes perform the function of guiding the next length into its place, establishing the jointed connection of one with the other at the surface, where everything can be seen and kept under full control. He described various details of the plan, and went on to say :—The passage of trains through the tubes can never do more than, first, neutralise their buoyancy, and then impose half a ton of weight per foot upon them. This should determine the vertical strength of the tubes. But I really make them much stronger, in order to enable them to sustain the far greater strain of being filled with water under any conceivable circumstances—as, for example, in war time if that should be thought necessary. It is probable that, in view of this, I shall leave the tubes with a buoyancy of one ton per foot, or even more, as a set off to this weight of water ; but in any case the ability of the tubes to sustain trains will be greatly in excess of that of any aerial bridges now constructed. These tubes will, in fact, from their intrinsic buoyancy, be practically bridges without any weight of their own to sustain, whereas with ordinary railway bridges their own weight is by far the greatest part of the burden they have to bear. It is difficult to explain in words alone the operation of laying the tubes. But, obviously, if one end only of a buoyant tube is forcibly taken down from the surface of the water to the bottom, or nearly to the bottom, the other end will float and rise somewhat above the surface. This being so, a pier wholly afloat at the time is brought up to the emerged end of the tube, and coupled up to it by enormous hinge-joints. The next length of floating tube is then brought up to the other side of the floating pier, and similarly jointed to it. The pier is now sunk by suitable means and under proper control, and as it goes down, carries with it the second end (so to speak) of the first-named tube and the first end of the last-named tube. The other end of this latter tube floats, of course, and the operation is repeated. In this manner tube after tube is laid, with piers between the successive lengths, until the whole is accomplished. The lines of railway, of course, pass continuously through the piers as well as the tubes. The whole operation is like the paying out of a huge cable link by link, tubes and piers alike forming, as it were, the links of the cable.

But as the tubes may be regarded as approximately of 20 feet in diameter and 300 feet long, formed of immense strength, the leverage brought upon each joint when at the bottom would be enormous during the greatest strength of the tide, and when the pier and adjacent tubes were floating at the surface. This consideration has made another arrangement necessary. I set the tubes which take the separate lines of railway at a distance of, say, 50 feet apart (this distance and other things varying with circumstances), and I connect the two tubes by partial webs, so as to form the whole into a large horizontal girder, having a tube for each flange. Only engineers can measure the immense, the altogether unexampled, strength of a girder of this character, perfectly unprecedented in the annals of engineering. But some idea of its strength may be conceived when it is compared with the vertical girders of the Britannia Tubular Bridge, observing that in the latter the top and bottom flanges were about $1\frac{1}{3}$ feet deep, set about 30 feet apart (if I remember rightly), while in the present case the flanges are 20 feet in diameter, and these are set 70 feet apart from centre to centre. Girders like these can be held by the end, and subjected with absolute security to all the strains which the tide can impose upon them during the depositing operations which I have described. The precise details, measurements and scantlings of this novel construction can only be determined after the line of the tube across the Channel has been very closely and carefully surveyed for depth, nature and consistency of bottom and tidal currents at surface and bottom, and when the best position for each pier has been selected. For this reason I abstain from presenting details to the Association. For the same reason I abstain from giving an estimate of the cost. The approximate cost will be between 12,000,000*l.* and 15,000,000*l.* sterling, a sum which will not be surprising when one considers that, if we for a moment take the cost of a rivetted steel tube to average 15*l.* per ton, and remember that the length of each of my two tubes, regarded as continuous, is 120,000 feet, the two tubes, if

approximately equivalent to a uniform thickness of 2 inches and 20 feet in diameter, would cost about 8,000,000*l.* sterling, without webs, extras for piers, concrete, expenses of laying, engineer's charges, interest during construction, or other financial requirements. On the other hand, it is to be observed that, for reasons soon to be stated, no extraneous cost for military defences or the like would be required in this case. Lest any one should be startled at the idea of the Channel Railway costing 12,000,000*l.* to 15,000,000*l.* sterling, I will point out that the bridging of the Missouri at St. Louis, where it was but 1,630 feet wide, cost 1,307,000*l.*, that more recently the Forth Bridge, crossing waters of an aggregate width of 5,700 feet, cost 3,200,000*l.* The only remark which it seems necessary to add is that, if a portion only of the railway traffic of Scotland crossing the Firth of Forth is sufficient, as it appears to have been, to justify an outlay upon one railway bridge of over 3,000,000*l.*, there can be no reasonable grounds for doubting that the traffic between the British Isles and the Continent of Europe would amply justify an outlay of 12,000,000*l.* to 15,000,000*l.*

There remains the question of national security, which many suppose the Channel Tunnel to infringe. I believe that my system puts the question of national security beyond all question. The very object of this proposal of a Channel Tubular Railway is to provide railway communication between England and France, without the least risk or possibility of the railway being employed for military purposes by an enemy of this country. In the case of the Channel Tunnel, were that carried out, it would undoubtedly afford a subterranean military road, which, were it once secured by an enemy, might, in the opinion of many, be held in spite of us, because this subterranean road, being deeply situated below the Channel bed, would be completely preserved from attack by the British Navy. The Channel Tubular Railway, on the contrary, is everywhere situated above the bed of the Channel, and could, therefore, be attacked at every point by dynamite. At the same time, it is so constructed and brought up along the foreshore (at a gradient of 1 in 80), as to be exposed for a length of no less than 3,160 feet to the direct fire of the guns of ships between the high-water and low-water limit. It will be constructed at this part so as to be easily penetrable by gun-fire, and any breach or hole made in it below high-water mark would, of course, admit the sea at the next tide to the whole interior of the tube. The target presented to the fire of ships would be of the length given above (3,160 feet), and it would present a surface of about 38,000 square feet, and would be readily struck by ships' guns. It is inconceivable that a railroad thus open, between high and low water, to injury and flooding by gun-fire and under water by torpedoes and otherwise, could ever be employed as a military road into this country. While thus avoiding the great military objection to the Tunnel, this plan likewise avoids equally the objections which would lie against a bridge, such as that which has been proposed in France for the Channel, the construction of which bridge would involve the necessity for impeding navigation by more than 120 mid-water piers, many of them so large that they might almost be called islands. The Tubular Railway is taken, at the gradient stated above, down along and for some distance parallel to the coast, and when at a distance of less than 1,200 feet from low-water mark it is already below the keels of the deepest ships, so that at that very small distance from the shore it ceases to offer any impediment whatever to navigation. The tube would nowhere fail to lie at an ample depth below the keels of all ships in the stormiest weather known to the Channel.

I will only add a word or two upon the question of ventilation. It will be observed that one of the tubes will be employed for traffic to France, and the other for the reverse traffic to England. The trains in each tube will therefore always pass through it in the same direction. The trains themselves will consequently act to some extent as ventilating pistons, forcing air out at one end of the tube and drawing it in at the other. By fitting wings to the engines or carriages, and throwing them out when necessary, the train may be made to fit the tube more nearly, so to speak, and thus to add to the efficiency of this source of ventilation. If other ventilation should be thought necessary, which is very doubtful if electric engines are employed, one or more of the piers can be fitted up as a ventilating station, with steam-engines, air-pumps, &c., the foul air of the tubes being forced into suitable chambers, and thence by non-return valves into the sea.

In conclusion, I ought perhaps to apologise to railway engineers and to those who construct tunnels and bridges for presenting my scheme to the world. But the truth is that the presence of the sea-water in the Channel seems to me to bring the question into my own domain, if I may so speak; and the processes of constructing and handling and placing the tubes upon the sea-bed really fall so naturally in with my experience and practice, that I feel fully justified in submitting it and in urging its adoption. I yield to no one in my desire to keep this country absolutely safe from military invasion under all circum-

stances, and I am convinced that no possible danger could arise from it. England must be left not only without a single ship in the Channel which can fire a gun, or a single boat that can tow a torpedo, before any possible harm can arise to us from this tubular railway; and were we reduced to that condition our invasion would need no tube to facilitate it. That is true, I believe, which an eminent officer of the Royal Engineers recently said to me, viz.:—"If French or other troops were such fools as to go into your tube with war existing or pending, you would deserve the thanks of your country for having provided so simple and certain a means of destroying them wholesale." I am glad to be able to add that a great many members of Parliament, who always strongly oppose the Channel Tunnel, are quite in favour of my system, and among these are several of such great influence that I have little fear of my Bill being successfully opposed in either House.

Mr. Abernethy, in criticising the paper, stated that he could not agree with Sir Edward Reed's approximation of cost, and he was afraid the scheme would not be favourably received by the financial world. He himself was in favour of Sir John Fowler's scheme for the construction of huge ferries whereby trains could be carried bodily across the Channel.

Mr. Greathead, who is one of the greatest authorities on tunnel engineering, referring to the question of cost, stated that the expense of constructing a submerged tube would be out of all proportion to the amount of work to be done. Moreover, the fact that the tube could be destroyed by dynamite by any lunatic who chose to explode it was in itself a sufficient condemnation of the scheme.

Professor M. Fitzgerald described at length a proposal made some time ago for channelling the North Channel between Ireland and this country.

Mr. P. F. Nursey said this question had been under consideration for 100 years, and he himself had read two papers before the Society of Engineers on the question of tubing the Channel for railway purposes. Notwithstanding this fact, he was not an advocate of either tube or tunnel, but favoured Sir John Fowler's scheme for improving the harbour at each side of the Channel, and constructing ships to carry the trains across.

Sir Benjamin Baker, referring to the question of cost, said he believed the scheme proposed by Sir Edward Reed would cost nearer thirty millions than fifteen millions. He knew the difficulties of engineering under a great pressure of water, and it was a work that he looked upon with great respect, born of experience. The railway companies, who were the people chiefly interested, had objected to Sir John Fowler's scheme on account of the cost of one and a half millions which it would involve. How much more likely was a scheme to make a profitable return which, according to Sir Edward Reed's own estimate, would cost from twelve to fifteen millions to complete?

Sir Edward Reed replied, and a vote of thanks was accorded to him for his paper.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

13491. Carl Heinrich Kopke, for "An improved fireproof material."

13493. Charles Farquhar Findlay, for "An improvement in gates for canal locks, docks or other waterways."

13498. Arthur Edgar Dainton, for "Improvements in or connected with sash fasteners."

13534. William James Gibbons, for "Improvements in the manufacture of door chains."

13556. Henry Harrington Leigh, for "An improved system of underground conveyance or haulage on an endless rope."

13587. Ludwig Dahmen, for "A self-lubricating arrangement for door and window hinges."

13651. Albert Deslandes, for "Improvements in locks and latches."

13683. George Williams and Frederick Harman Peter Berlyn, for "Improved method and means for producing building decorations and ornamental letters."

13724. Joseph Gibson and Joseph Allen, for "An improved chimney cowl."

13816. For "Improvements in appliances for splicing or connecting poles for use in scaffolding or electrical purposes."

The Contract Reporter.

to The Architect.

LONDON, SEPTEMBER 4, 1891.

COMPETITIONS OPEN.

ABERAVON.—Sept. 10.—Designs are invited for the Proposed Port Talbot Technical and Intermediate School. Mr. M. Pennant, Town Clerk's Office, Aberavon.

BATH.—Oct. 10.—Designs are invited for Additions to Municipal Buildings. Mr. John Stone, Town Clerk, Guildhall, Bath.

EASTLEIGH.—Sept. 28.—Plans are required for Sewerage and Sewage Disposal. Mr. Joseph Robins, Clerk to the South Stoneham Rural Sanitary Authority, 19 and 20 Portland Street, Southampton.

LUTON.—Sept. 8.—Designs are invited for Alterations to Waller Street Plait Hall. Mr. E. J. Lovegrove, C.E., Town Hall, Luton.

SHREWSBURY.—Sept. 30.—Designs, &c., are invited for Building Police Station, Constable's House, &c. Mr. W. C. Eddowes, Borough Surveyor, The Square, Shrewsbury.

SOUTH STONEHAM.—Sept. 28.—Designs, &c., are invited for Sewerage and Disposal of Sewage. Mr. Joseph Robins, 19 and 20 Portland Street, Southampton.

VICTORIA, BRITISH COLUMBIA.—Designs are invited for Christ Church New Cathedral. Mr. Owen T. Bulkeley, Church House, Dean's Yard, Westminster, S.W.

CONTRACTS OPEN.

ANNALONG.—Sept. 10.—For Improvements to Parish Church. Mr. Henry Seaver, Architect, 128 Royal Avenue, Belfast.

BARGOED.—Sept. 14.—For Classroom to Board School. Mr. John Williams, Architect, 4 Edward Street, Morgan Town, Merthyr Tydfil.

BARKING.—Sept. 10.—For Sewering and Making Roads. Mr. C. J. Dawson, Surveyor, Local Board Offices, East Street, Barking, Essex.

BARRY DOCK.—Sept. 7.—For Building School. Messrs. Seward & Thomas, Architects, Queen's Chambers, Cardiff.

BIRMINGHAM.—For Building Manufactory, Great Lister Street. Mr. F. J. Yates, Architect, 88 Colmore Row, Birmingham.

BLACKWALL.—Oct. 12.—For Constructing (by Compressed Air) and Maintaining Carriageway and Footway Tunnel under the River Thames. Mr. H. De la Hooke, County Hall, Spring Gardens, S.W.

BLACKWOOD.—Sept. 14.—For Additions, &c., to Board Schools. Mr. W. L. Griffiths, Architect, High Street, Newport, Mon.

BRADFORD.—Sept. 4.—For Extension of Premises, Bolton Road. Messrs. T. H. & F. Healey, Architects, Tyrrel Street, Bradford.

BRADFORD.—Sept. 7.—For Extension of Thorncliffe Laundry. Messrs. Milnes & France, Architects, Bradford.

BRIDGEND.—Sept. 7.—For Building Drill-hall. Mr. P. I. Thomas, Architect, Bridgend.

BRISTOL.—Sept. 12.—For Foundations, Retaining-wall, Concrete, &c., for Electric Lighting Station. Mr. H. Williams, Architect, 21 Clare Street, Bristol.

CARDIFF.—Sept. 16.—For Alterations and Additions to Free Library. Messrs. Seward & Thomas, Architects, Queen's Chambers, Cardiff.

CHIPPENHAM.—Sept. 10.—For Sewerage Works. Mr. A. H. Lapham, Surveyor, Biddestone, near Chippenham.

DARTFORD.—Sept. 12.—For Supplying and Setting Boilers, Engine, &c. Messrs. A. & C. Harston, Architects, 15 Leadenhall Street, E.C.

DOVER.—Sept. 8.—For Supply of Broken Granite. Mr. E. Wollaston Knocker, Town Clerk's Office, Dover.

EASTLEIGH.—Sept. 16.—For Building Boys' School, Cranbury Road. Messrs. W. H. Mitchell, Son & Gutteridge, Architects, 9 Portland Street, Southampton.

ENFIELD.—Sept. 9.—For Supply of Broken Granite. Mr. E. Letchworth, Court House, Enfield.

FELIXSTOWE.—Sept. 15.—For Building Local Board Offices. Mr. George S. Horton, Surveyor to the Local Board, Felixstowe.

FENNY STRATFORD.—Sept. 7.—For Building Chapel and Schools. Pastor H. S. Smith, Fenny Stratford.

FLOCKTON.—Sept. 14.—For Laying Water Pipes, Constructing Meter House, Pumping Station, &c. Mr. W. J. Wood, Engineer, Flockton.

FULHAM.—Sept. 9.—For Making Roads. Mr. W. Sykes, Town Hall, Walham Green.

FULHAM.—Sept. 9.—For Supplying and Laying Creosoted Deal Blocks. Mr. James P. Norrington, Town Hall, Walham Green.

GLASGOW.—Sept. 8.—For Construction of Gasholder Tank, Temple Gasworks, Maryhill. The Engineer, 45 John Street, Glasgow.

ELECTRIC LIGHTING.

Arthur B. Gill & Co.

ELECTRIC LIGHT AND GENERAL ENGINEERS,

ALL WORK GUARANTEED.

GREAT OUSEBURN.—Sept. 12.—For Building Detached Infirmary, for Sixteen Beds. Mr. C. Hornsey, Architect, 16 Railway Street, York.

HAILSHAM.—Sept. 14.—For Building Chapel. Mr. O. Mitchell, Architect, 8 Alexandra Terrace, Hailsham.

HAMPSTEAD HEATH.—Sept. 29.—For Erecting Public Conveniences. Mr. H. De la Hooke, County Hall, Spring Gardens, S.W.

HANLEY.—Sept. 12.—For Building Two-storey Warehouse, &c., and Extension of Offices at Phœnix Works. Messrs. Wm. Sugden & Son, Architects, Leek.

HARPURHEY.—Sept. 9.—For Building Fire Station. The City Surveyor, Town Hall, Manchester.

HENDON.—Sept. 7.—For Kerbing and Tar Paving. Mr. W. A. Tootell, Clerk, Rural Sanitary Authority, Edgware.

HORNSEY.—Sept. 12.—For Building Public Baths and Washhouses. Mr. A. Hessell Tiltman, Architect, 70 Torrington Square, W.C.

HORNSEY.—Sept. 16.—For Making Good Roads. Mr. T. De Courcey Meade, Engineer, Local Board Offices, Southwood Lane, Highgate, N.

HULL.—Sept. 18.—For Supply of Cast-iron Cylinders, Columns, Caps, Shoes, &c. Mr. A. E. White, Borough Engineer, Town Hall, Hull.

ILKESTON.—Sept. 16.—For Building Pair of Semi-detached Villas. Mr. George Haslam, Architect, Euclid House, Ilkeston.

ISLINGTON.—Sept. 12.—For Building Public Baths and Washhouses. Mr. A. H. Tiltman, Architect, 70 Torrington Square, W.C.

KENDAL.—Sept. 11.—For Building Dwelling-house, &c. Mr. Stephen Shaw, Architect, 45 Highgate, Kendal.

LEIGH.—For Building Cheese Factory. Mr. G. Wooddisse, Church Leigh, Stoke-on-Trent.

MANCHESTER.—Sept. 10.—For Excavator and Mason Work, Gymnasia, Birchfields, The City Surveyor.

MANCHESTER.—Sept. 15.—For Supplying and Fixing Ironwork in Construction of Gymnasia, Birchfields. The City Surveyor, Town Hall, Manchester.

MARYPORT.—Sept. 15.—For Building Nine Shops and Dwelling-houses. Mr. C. Eaglesfield, Architect, Maryport.

MERIDEN.—Sept. 7.—For Repairing Bells at Workhouse, Fitting up New Bells, &c., and Providing and Fixing Electric Bells. Mr. Arthur Seymour, 10 Hay Lane, Coventry.

NEW BARNET.—Sept. 9.—For Building Small House. Mr. Joseph White, 35 High Street, Barnet.

NUNEATON.—For Supply of Gravel and Sand. Mr. Jos. S. Pickering, Engineer, Town Hall, Nuneaton.

OXFORD.—Sept. 12.—For Building Stables, Shedding, &c. Mr. W. H. White, City Engineer, Oxford.

PENARTH.—Sept. 5.—For Private Street Improvement Works. Mr. J. W. Morris, Clerk to the Local Board, Penarth.

PONTYPRIDD.—Sept. 5.—For Converting House, Hopkin's Town, into Sunday School. Mr. W. I. Morris, Norfolk House, Pontypridd.

READING.—Sept. 10.—For Removing Blake's Bridge, &c. Mr. Arthur T. Walmisley, 9 Victoria Street, Westminster, S.W.

REIGATE.—Sept. 8.—For Sewerage and Sewage Disposal, Mr. John Anstie, Engineer, 17 Victoria Street, Westminster. S.W.

SALFORD.—Sept. 4.—For Building Stable and Fire-engine Shed. The Borough Engineer, Town Hall, Salford.

SEVENOAKS.—Sept. 4.—For Constructing Sewers and Making-up Roads. Mr. Jabez Mann, Surveyor, Local Board Offices, Argyle Road, Sevenoaks.

SITTINGBOURNE.—Sept. 7.—For Supply of Broken Granite. Mr. W. J. Harris, Local Board Offices, Sittingbourne.

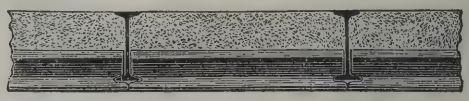
SOUTHAMPTON.—Sept. 8.—For Strengthening Portion of Town Quay Extension for Electric Cranes. Mr. J. G. Poole, Surveyor, 2 Portland Street, Southampton.

SOUTH HORNSEY.—Sept. 9.—For Supply and Delivery of Broken Granite, Flints, Gravel and Ware Ballast. Mr. W. Jameson, Local Board Offices, Milton Road, South Hornsey, N.

SOUTH SHIELDS.—Sept. 8.—For Construction of Tanks and Gearing for Shipment of Refuse. Mr. J. Watt Sandeman, Engineer, 2 Nicholas Buildings, Newcastle-on-Tyne.

SOWERBY BRIDGE.—Sept. 11.—For Building Eight Houses, Carr Head. Mr. S. Wilkinson, Architect, Sowerby Bridge.

STOCKPORT.—Sept. 7.—For Building Fireproof Mill. Messrs. Stott & Sons, Architects, 5 Cross Street, Manchester.



SUTTON.—Sept. 7.—For Constructing Sewers. Mr. John Anstie, 17 Victoria Street, S.W.

IMPROVED

FLAT BRICK FIRE-PROOF FLOORS.

Transverse Section.

Longitudinal Section.

NO THRUST ON WALLS.

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with moulded projections protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known

The soffits of the bricks are specially prepared to key up the ceiling plaster. No laths or counter ceiling are necessary. They are not affected by water, acids, or alkalies, and they may be fixed during the progress of building, thus dispensing with the use of internal scaffolding.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost of a building with floors of this construction does not exceed that of one with the ordinary combustible timber floors of corresponding strength.

HOMAN & RODGERS,

Engineers and Patentees,

BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our DESIGNS, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, J. H. PICKUP & CO.

TRADE NOTES.

IT may be remembered that in the spring of 1888 Professor Oliver Lodge, F.R.S., gave two lectures on Lightning Conductors to the Society of Arts, in which he promulgated several revolutionary views on the subject, and supported them by a series of direct experiments with Leyden jars. The experiments also branched off into a study of electric waves, a subject which was being simultaneously worked at in Germany by Hertz. At the British Association meeting in Bath that same year, Professor Lodge's views were good-naturedly controverted by Mr. W. H. Preece, partly for the purpose of raising a discussion and partly because some of them were rather startling. Since then a more complete communication from Professor Lodge to the Institution of Electrical Engineers and to many scientific periodicals, as well as a recent paper read before the Royal Society, are generally held to have fairly substantiated the new views, and we understand that during the present year Professor Lodge has been engaged in welding together the principal portions of all this literature, with sundry additions, and that Messrs. Whittaker & Co. propose to issue it as a large volume of their Specialists' Series in the course of the autumn.

THE new Workhouse Hospitals, Reading, which are nearing completion, are being warmed and ventilated throughout by Mr. E. H. Shorland, of Manchester. In the large wards are fixed Shorland's double-fronted patent Manchester stoves, with descending smoke flues, and in the smaller wards Shorland's patent Manchester grates.

THE Grand Hotel, Cromer, opened last month, has been fitted up with H. Heim's patent smoke-consuming "Calorifer" heating apparatus, under the superintendence of the architects, Messrs. G. J. & F. W. Skipper, of Norwich. The total cost of the buildings exceeded 15,000*l.*

WE are glad to learn that the damage done by the fire at the London Parquetry Works, Grove Lane, Camberwell, S.E., on Wednesday night is covered by insurance, and that business will be carried on as usual.

THE extent to which new and superior quality building materials have come into use within the last ten years is well illustrated, the *Canadian Architect* says, by the growth of the Canadian pressed brick industry. Five years ago pressed brick was a rarity. Three or four years ago some enterprising Canadians began to manufacture pressed brick, and in a short time were able to offer an article which stood a fair comparison with the imported brick, and at half the price. The result is a wonderfully increasing demand, and a multiplication of manufacturers from one to four or five. Not only is pressed brick everywhere to be observed in the cities, but from the towns throughout the country there also comes a considerable demand. The facilities for cheap production are such that it is believed Canadian manufacturers would be able to compete with advantage for business in some of the American cities near the border.

A WEAVING-SHED is about to be opened for the winter session in connection with the Stockport Technical School. The shed, which is now complete, is 60 feet by 80 feet. The machinery is all of the most modern type. Mr. Greaves, of Mile End, Stockport, has presented looms for the production of fancy fabrics.

PROFESSOR SHUTTLEWORTH, having introduced the electric light into the City church of St. Nicholas Cole Abbey, of which he is rector, declares that henceforth the congregation "will be relieved of the insufferable atmosphere of the gas, which put the organ out of tune and the people out of temper, and spoiled the colour on the walls and ceiling."

THE plumbers, gas and steamfitters of London, Ont., the *Canadian Architect* says, having failed to induce their employers to reduce their hours from fifty-four to fifty per week and increase their wages from 23 to 25 cents per hour, have for the past three weeks enjoyed a holiday, while the master plumbers have been forced to take off their coats and "earn their bread by the sweat of their brows." The strike, which promises soon to cease, has brought a few outsiders to the city, and these, with the repentant strikers, who do not like the idea

of resting without pay, are managing to keep pace with the work. The time chosen was inopportune, as most of the spring contract work has neared completion, and none of the trades have been troubled with too much work this year. If a movement had been on foot in Canada similar to the one so successfully inaugurated here by the Plumbers' Company, the above paragraph would probably not have been written. Trade disputes would be equitably settled without resorting to strikes when the incompetent operatives were weeded out by some system akin to registration.

THE Sanitary Committee of the Leeds Town Council have resolved to recommend the Council to erect another destructor in Meanwood Lane, the estimated cost of which is 4,000*l.*

THE Birkenhead Finance Committee have accepted the tender of Messrs. A. White & Sons to decorate the principal entrance, staircase and certain rooms and corridors at the Town Hall for 500*l.*

THE Shoreditch Vestry have decided to obtain power to supply electricity within the parish of Shoreditch for public and private purposes, and to memorialise the Board of Trade for a provisional order.

THE contract for the drainage of Flamborough has been let to a Hull firm for 1,700*l.*, and will be begun at an early date.

APPLICATION is to be made for a loan in order to proceed with the waterworks for Colwyn Bay and district, the cost being estimated at 25,000*l.* Mr. Farrington is the engineer.

THE Liverpool *Journal of Commerce* says:—The Upper Congo abounds in forests, and many of the woods are hard, and would prove of value in Europe. Mahogany and ebony, camwood, and a timber strong almost as teak, known locally as ironwood, are found in the interior, but the question of transport stands in the way of their being utilised by commerce.

NEW assembly rooms have been opened at Hayden, and every care has been taken to make the ventilation as efficient as possible. It was entrusted, after careful inquiries as to the capabilities of various systems, to the Climax Ventilating Company, of 15 Great George Street, Westminster, the appliances being specially designed by them to harmonise with the architectural features of the building.

A TRADE circular has just been issued by Messrs. Allard & Sons, of Paris, New York and Regent Street, London, calling attention to their specialities in work, such as carved oak joinery and in other woods, parquet flooring, marquetry, marble and marble mosaic, fibrous plaster work of every description, Carton Pierre, artistic iron and bronze work and artistic decorations, also to their special manufacture of artistic furniture of all kinds, &c.

AMERICAN NOTES.

ACCORDING to the *Railway World*, Philadelphia, steam-pipes have recently been made of ramie fibre, hardened under tremendous hydraulic pressure, and possessing a tensile strength equal to two and a half times that of steel. The ramie fibre, or China grass, has the property of being unaffected by moisture; it will not shrink nor swell, it is a non-conductor of heat, it cannot rust, and these features, together with its great strength, are all desirable in steam-pipes, its utilisation in this line being regarded, therefore, as one of the possibilities of the future.

THE New York correspondent of the *Public Ledger* says:—Looking from the *Ledger* bureau in the Pulitzer Building one of the most conspicuous objects on the Jersey shore is the new Pennsylvania railroad depôt. Its spacious dome looms up in almost majestic proportions, and is visible by night as well as by day. The train-shed is now complete, and work has been begun on the waiting-room. The former is one of the biggest structures of the kind in the world, being 653 feet long, 256 feet wide and 115 feet high, and weighing 4,550,000 pounds. It gives space for twelve tracks with intervening platforms. The waiting-room, now in course of construction, will be 188 feet long by 84 wide, interior measurement. The elevated tracks through Jersey City, enabling the running of trains at speed in the city, the new and spacious depôt, the double-deck ferry-boats now building, the new ferry-houses in New York, with a bridge over West Street, soon to be constructed, are all notable improvements in which travellers on the Pennsylvania Railroad are already beginning to rejoice.

THE first courses of white marble are, *Stone*, of Indianapolis, says, being laid in the Montgomery Street front of the D. O. Mills Building in San Francisco. The two fronts of the building will be of Inyo white marble up to the sills of the third storey. The Montgomery Street front will be ornamented with eight columns of beautifully-polished moss-agate, also from the Inyo quarries, and will have carved capitals of the composite Corinthian order. The main arches will be profusely and artistically carved. All the inside wainscoting will be of highly-polished Inyo marble of an orange colour, streaked with

veins and resembling Italian sienna. The stair steps in the building and the floor tilings will be made of white marble. There will be used also a golden-coloured moss-agate or dendritic marble. The cost of the stone alone will aggregate 100,000 dols. Terra-cotta and pressed brick will be used above the stone front. There will be eleven storeys above the basement, and when completed the edifice will be an enduring and handsome monument of the superiority of the marble quarries of California. The stone of a recent test was crushed at a pressure of 33,600 lbs. to the cubic inch, while Italian marble crushed at pressure of 17,000 lbs.

THE *Sanitary News* of Chicago says :—The plumbers in England are continually advancing with their system of licensing. They are working for a national system of licensing plumbers through enactments of Parliament. At every meeting held by the plumbers this matter is freely and strongly endorsed, and many influential sanitarians and physicians favour the movement. There are several reasons why such a system should succeed, and why it would be just as good for this country as for England. Besides these reasons, it is clearly fair that the plumbers who push ahead and qualify themselves for the work they have undertaken should themselves be protected from the incompetent and untrustworthy who have spent but little time, labour and money in acquiring just enough knowledge of their trade to be dangerous.

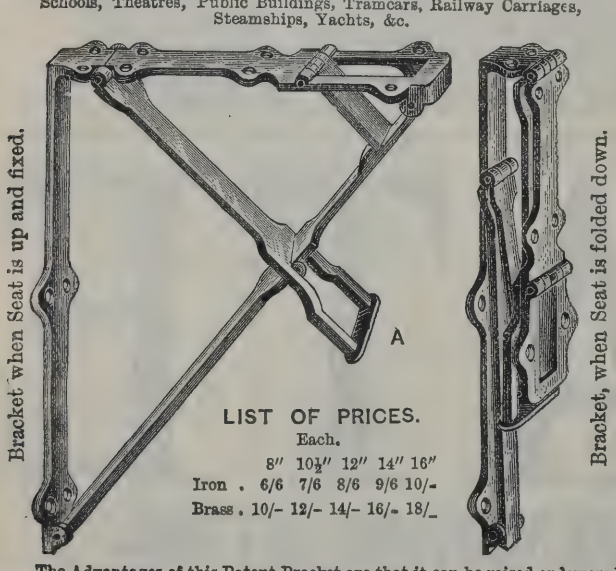
IN the report of the proceedings of the meetings held by the American Forestry Association, just issued, is an interesting paper by Mr. Edgar T. Ensign, forest commissioner of Colorado, on the "Rocky Mountain Forests," in which the following occurs :—The forests, though mainly coniferous, are usually situated upon the mountain slopes, at altitudes varying from 4,500 to 12,000 feet above the sea. According to the best data obtainable by the writer, and including in the estimate all kinds of forest growth, light and heavy, valuable and inferior, the approximate forest areas in square miles of the several divisions are as follows : — Idaho, 15,990 ; Montana, 26,285 ; Wyoming, 12,060 ; Utah, 6,000 ; Colorado, 16,625 ; New Mexico, 12,500 ; Arizona, 10,300 ; the total being in round numbers 100,000 square miles, or 13·2 per cent. of the total land area. It will be seen Montana has the largest and Utah the smallest forest area. The relatively extensive forests are regarded as due to the fact that the region receives in many parts a comparatively large precipitation of moisture, and has abundant sunshine during a large portion of the year, although nearly surrounded by arid or semi-arid plains, and subject more or less to conditions of aridity, heat and cold inimical to forest growths. Except for the scourge of fire the forests would probably be at least one-third greater in extent than they are. Upon the western slope of the mountains the annual rainfall is greater than on the eastern, and this is the reason given for the presence there of the larger and more important forests. Furthermore the forests of that region have suffered less from fire and depredation than elsewhere. In all parts of the country northern exposures are the most favourable to forest growth as affording maximum conditions of moisture and a minimum degree of evaporation.

COLOUR in railroad carriage painting is a matter that is seldom thought of, as the deep red is so common that it may be said to be standard, says the Greenville *Advance-Argus*. However, just above Greenville, on the Franklin branch of the Lake Shore, may be seen carriages of a bright yellow. This æsthetic shade is the standard on the Lake Shore system. Besides the standard colour and the yellow, white, blue and royal red are in use, but only on certain trains. Several fast trains on the Baltimore and Ohio—Philadelphia and Reading route—between New York and Washington are resplendent in royal purple, and known as the "Royal Blue" expresses. The Columbian and Keystone expresses on the Pennsylvania are painted a bright royal red, and look like meteors as they shoot past way stations. On a Massachusetts road there is a train which is entirely white, and as it is a night train, is well named "the ghost train." The famous fast mail on the New York Central and the Lake Shore is also of white.

BUILDING AND BUILDERS.

PLANS have been prepared by Mr. H. Howard, surveyor to the Board, for new offices for the Littlehampton Local Board, which will be erected in Beach Road.

THE Brighton Sewers Board have been authorised to borrow 1,000*l.* for the construction of a retaining wall at Roedean.



AT Llandudno forty building plots, situated on the Conway Bay side of Llandudno, the property of the Ecclesiastical Commissioners, have been offered for sale by auction, the idea being the construction of a west parade and several roads, to be named West Llandudno. Twenty of the lots were sold.

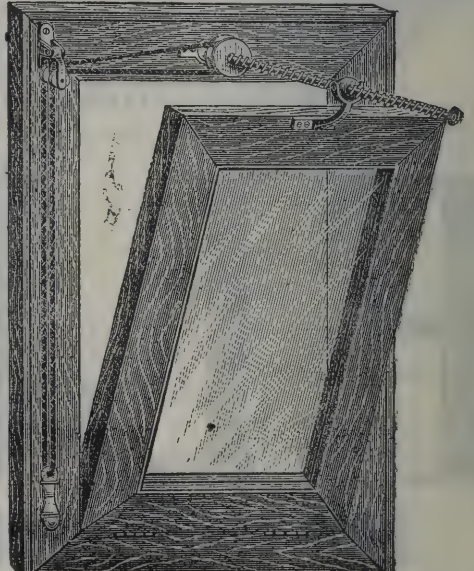
SPECIALTIES:

GROOMBRIDGE'S Patent SELF-ADJUSTING BRACKET,
For Seats, Shelves, Tables, &c. Specially adapted for use in Churches, Chapels, Schools, Theatres, Public Buildings, Tramcars, Railway Carriages, Steamships, Yachts, &c.



LIST OF PRICES.

	Each.			
	8″	10½″	12″	14″ 16″
Iron .	6/6	7/6	8/6	9/6 10/-
Brass .	10/-	12/-	14/-	16/- 18/-

The Advantages of this Patent Bracket are that it can be raised or lowered by the action of only one hand. It is automatic and perfect in action, and the extreme simplicity of its arrangement prevents any possibility of its getting out of order.

PRESTON'S Patent SCREW ADJUSTMENT,
For opening, closing, and securely fastening Fanlights, Casements, Skylights, &c.

Lighter.	A866, ⅜-inch Rod × 12 inch.	each. 8s.
	All Brass	7s. 6d.
	Brass Wheel, Iron Fittings	
	A749, ½-inch Rod × 18 inch.	each. 11s. 6d.
	All Brass	
	Brass Wheel, Iron Fittings	10s.

This thoroughly efficient Screw Adjustment provides for opening, closing, and securely fastening Fanlights, Casements, &c., and will by its extreme simplicity commend itself to Architects, Builders, &c.

Working Models of the above and other Specialties may be seen at our new Show-Rooms, 57 HOLBORN VIADUCT, E.C. Architects and Builders are invited to inspect same.

AN hotel is to be built at Southend on the site at present occupied by the Switchback Railway. The plans have been prepared by Mr. F. Chancellor, of Chelmsford.

A CHAPEL-OF-EASE is about to be built in the village of Coulton, an outlying part of the extensive parish of Hovingham.

THE Town Council of Stratford-on-Avon have selected a site in Sheep Street for the erection of a fire-engine station.

A FREE reading-room has been opened at the Hampstead Public Library for the use of working men and women in the borough. The building has been given by a friend in remembrance of the late Miss Coates, of Upper Terrace Lodge. It is a large lofty room, erected by Messrs. Burford & Son from the designs of Mr. Horace Field, architect, of Church Row.

A NEW Board school at Colinton, designed by Mr. R. Wilson, architect, Edinburgh, has just been opened.

A SITE has been secured for the proposed new church of St. Aidan, in the School Lane district of Walton-le-Dale and Bamber Bridge, Preston.

VARIETIES.

THE New Public Buildings and Free Library, Oldbury, are to be opened on September 8.

THE head-masters of the Dundee Public Schools are to report to the School Board whenever the temperature in any room is below 50 deg.

THE Water Committee of the Liverpool Corporation have decided that the amount awarded in the arbitration of Newell *v.* the Corporation, as well as half the costs of the proceedings, shall be paid.

THIS week, at Clacton-on-Sea, a number of building plots were put up to auction, including an hotel site on the Marine Parade. This found a purchaser at 2,000*l.*, and the aggregate of the sale reached 3,400*l.*

THE first sod of a new reservoir to be constructed in the Wessenden Valley has been cut by the Chairman of the Waterworks Committee of the Huddersfield Corporation. The reservoir will cover an area of 41½ acres, and will be capable of containing 400 million gallons of water.

THE Stockport Town Council have consented to the transfer of the Technical School to the Corporation. The liability incurred will be 1,000*l.* a year.

PLANS have been prepared by Mr. C. C. Hooley, C.E., of a main-drainage scheme for Irlam and Cadishead, of the Barton Rural Sanitary District.

IT has been decided by the Manchester City Council to apply to the Local Government Board to sanction the borrowing of 150,000*l.* for the purpose of carrying out the electric-lighting scheme of the Corporation.

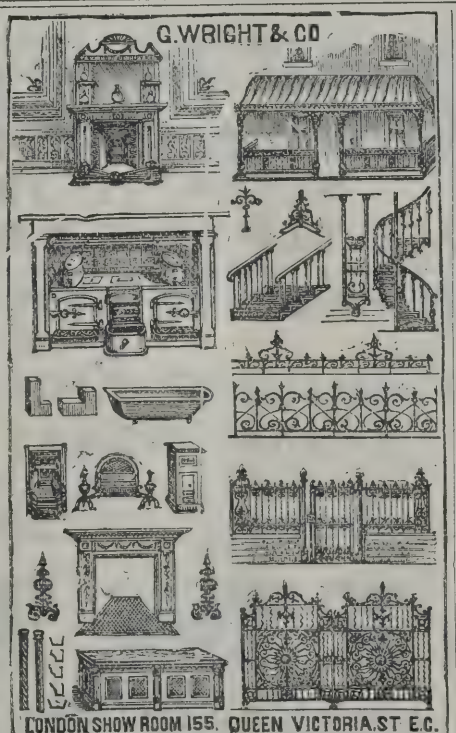
AT the meeting of the Town Council, Burton-on-Trent, it was agreed to relay the sewer in Guild Street, at a cost of 3,000*l.*, Messrs. Bass & Co. agreeing to pay 1,000*l.* towards the cost on condition that the Corporation gave up their right to go along the company's middle yard. It was reported that steps were being taken to press forward the introduction of the electric light, but it was stated that probably the light would not be in use through the Corporation until the winter of 1892.

IN the report of the sanitary condition of Glasgow just issued it is recorded that a large service is still being given by the Department in the testing of drains and soil-pipes; 2,216 smoke tests were applied during this year. Out of 836 tests applied for the first time to occupied properties only 105, or 12½ per cent., were found satisfactory.

THE *Irish Times* of the 1st says:—Mr. B. Colles Watkins, the secretary of the Royal Hibernian Academy, leaves town to-night for the County Kerry, where he will be engaged during the autumn upon several important works. Mr. James Brenan, R.H.A., has preceded him on a visit to the same district of Ireland.

A CORRESPONDENT writes:—I lately visited O'Connell's birthplace, and was astonished to find it roofless, walls fast crumbling to decay.

THE LONDON COUNTY COUNCIL AND NEW ROADS.



LAST week, at the North London Police Court, Messrs. James Edmondson & Son, builders, of North Holme, Highbury, were summoned before Mr. Haden Corser, at the instance of the London County Council, for unlawfully laying out a road, passage or way, known as Newington Turning, as a public carriageway in "such a manner that such road, passage or way would not directly communicate at both ends with a public carriageway," contrary to the 53rd and 54th Vic., cap. 243. Mr. Buckmaster, barrister, appeared for the County Council, and Mr.

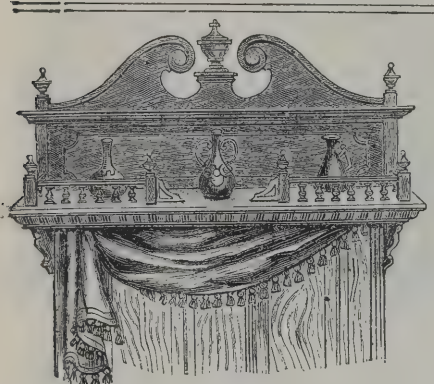
READING CASES FOR THE ARCHITECT.
Price 2*s.*—Office: 175 Strand, London, W.C.

Glen was counsel for the defendants. Mr. Buckmaster said that Newington Turning was a footway which ran from Aberdeen Road to Highbury New Park. The defendants had laid out one portion of this turning as a carriageway to the required width of 40 feet, but they had failed to make the whole of the footway a carriageway. For the defence it was shown that the portion complained of was only a portion of a scheme for covering the estate with houses, and that when the estate was finished Newington Turning would be intersected by another carriageway or road, which had already been staked out. Mr. Glen said that the Council's contention was that no single house could be erected unless the whole of the estate roads were made up and opened. Mr. Corser said that the Council had not made out their case, and he dismissed the summons with 5*l.* 5*s.* costs. Notice of appeal was given.

TIMBER-TESTING IN AMERICA.*

THE Division of Forestry of the United States Department of Agriculture has commenced a series of examinations and tests of American timbers, which far exceeds in magnitude and in scientific thoroughness anything ever before undertaken in this direction. There are three departments of the work.

I. *The Selection of the Timber.*



The trees to be examined and tested are first selected by a competent botanist and forester from five or more localities, four large trees of a given species from each place, these sites differing from each other as much as possible in climate and soil conditions. These trees are cut up into logs from 6 to 18 feet in length, with intervening discs 8 inches long. A complete record is kept of the botanical names, conditions of growth, time of cutting, age of tree, size, height, &c., and the north and south sides of each log and disc are marked on them, together with the number of the tree and of the log. The logs are shipped to St. Louis, and the discs are sent to Ann Arbor, Mich. Discs are also cut from younger trees and sent to Ann Arbor.

II. *The Physical Tests.*

The physical tests are carried out at the Washington University Testing Laboratory, St. Louis, under the direction of the writer. The logs are first sawed into appropriate sizes at an ordinary saw-mill. Each log is marked off on its end by a stencil-plate, in such a way as to obtain a series of 4-inch by 4-inch sticks in a north and south zone, and as large a stick alongside as the log will allow, up to 8 inches by 16 inches. Each stick is marked with a die with the number of the tree, the number of the log in that tree and the number of the stick in the log, the numbers being on the lower end of the log, and reading upright when the north side is upward. In this way each stick carries a legend which cannot be effaced, which fully identifies it. A series of stamps, corresponding to the stencils, is used to show in the note-book the way in which the log was cut and marked. After sawing, the sticks are carefully stacked under shelter to await the tests. In the course of from one to three months, after sawing one end (half) of each 4-inch by 4-inch stick is tested, and also some of the large sticks. The regular tests are as follows :—

1. *The Cross-bending or Beam Test.*—In this the load is always put on at the same rate, so as to produce an increase in the deflection of one-eighth inch per minute, and continued uniformly up to rupture. The simultaneous loads and deflections are read off about eight or ten times during the test, the scale-beams always being kept balanced and the deflection read off by means of a micrometer screw on the small beams, and from a thread over a paper scale on the large beams. The 4-inch by 4-inch sticks are tested in lengths of 60 inches between knife edges, all bearing-surfaces being protected by iron plates. The machine used was specially designed for this kind of work, and was described in the *Engineering News* of September 14, 1889. The large beams are broken on a machine of an original design, consisting of a hydraulic cylinder, plunger, screws and cross-head, made by Riehlé Bros., and similar to those parts used in their 100,000 lb. testing machines. The base or beam part of the machine consists of two long leaf-yellow pine sticks, 6 inches by 20 inches by 24 feet long, both being clear, straight-grained wood. Between these there is a steel flitch plate, $\frac{3}{4}$ inch by 18 inches by 20 feet long, all bolted together through their neutral axes. The weighing is done in a standard 100,000 lb. Riehlé machine near by, both being connected up with the same pump, and the weighing-machine being blocked. The plungers of the two machines are of the same size, and therefore, except for the difference in the frictional resistances of their plunger packings, they should show the same loads for the same unit pressure in the pump. They have the same kind of leather cup-packing, and, when tested by

CLIMAX VENTILATING CO., 15 GREAT GEORGE STREET, WESTMINSTER, S.W.

nests of calibrating springs, they show equal loads for equal deflections of springs. These calibrating springs were first tested on the Emery machine at the Watertown Arsenal, and hence both these machines are now standardised with that one. Since this large beam machine will place a load of 100,000 lb. on a beam 24 feet long, there has probably never been a wooden beam or a rolled iron or steel beam which could not be broken on this machine if taken in a length from 20 to 24 feet. This is also the only beam machine of large capacity with which the writer is acquainted. There are following nuts placed on the power screws, by means of which any given deflection can be held, and in this way time tests can be made on large beams. From the plotted results, loads and deflections, the modulus of elasticity and the total resilience of the timber up to the point of maximum loading in inch-pounds per cubic inch of timber are computed in addition to the strength.

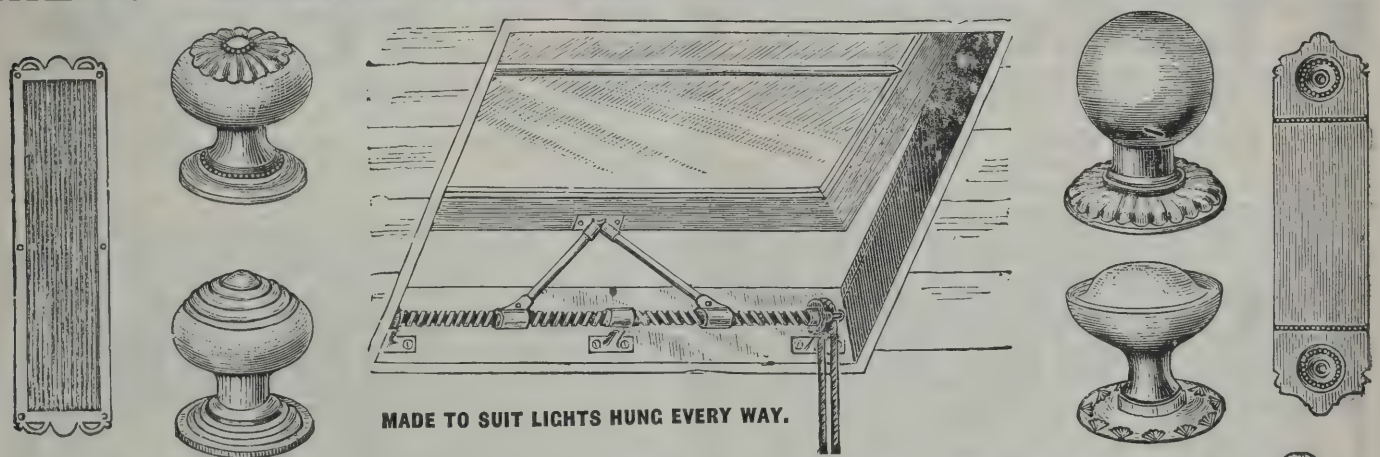
1. *The Percentage of Moisture.*—After breaking the beam, it is next bored through 18 inches from each end, and one-third the width of the stick from one side, and the borings used for determining the percentage of moisture. Professor Bauschinger has shown that when the moisture in a stick falls below 20 per cent., and especially when below 15 per cent., the strength increases very rapidly as the moisture diminishes.

3. *Specific Gravity and Width of Annual Rings.*—The ends of the broken beam are now cut off, and used for making the other tests named below. One of these is weighed and measured, and the specific gravity determined. The number of annual rings is also counted in a radial direction across the stick, and the average number per inch is recorded.

4. *Crushing Endwise.*—From each 4-inch by 4-inch stick there is cut a section 8 inches long, and from each large beam there is cut a column 40 inches long and 4 inches by 4 inches in cross section, and these are tested in compression endwise until the fibres are crushed down and the maximum load passed.

5. *Crushing Across the Grain.*—From each beam there is taken a section and crushed across the grain on an area 4 inches by 4 inches. The maximum load is found to occur when the compression is about 3 per cent. of the height, and hence this amount of distortion is taken as the standard and the compression load found at this limit, which is also considered a reasonable limit in practice.

6. *Tensile Tests.*—The tensile strength is found by taking a piece 1½ inches by 2½ inches by 15 inches long, and cutting it down on circular curves to ⅜ inch by 2½ inches at the centre and then pulling it on the 100,000 lb. Riehlé machine. It is held between the ordinary flat wedge-shaped grips. It is very difficult to break timber in tension, but after trying various shapes and methods of holding, the above was found most simple and entirely satisfactory.



7. *Shearing Test.*—The shearing strength is found by pulling out the ends of slotted holes. A piece 2½ inches square is slotted 1 inch from each end, with a hole ¾ inch by 1 inch. Steel pins are inserted in these and pulled by means of suitable stirrups. The two holes are cut at right angles to each other and both are pulled out, thus getting the shearing strength both ways with reference to the direction of the annual rings. The stick is kept from spreading, or splitting out, by means of hand clamps which are put on outside the slotted holes and screwed up to a bearing before the test begins, the initial pressure being only a few pounds.

In all the above tests the direction of the rings is sketched in and the records show also its exact position in the log and in the tree, so that all known pertinent facts are recorded. It is only in this way that the laws governing the strength of timber can be found. The reserved sticks will be tested some two years or more later after seasoning, which will be under shelter. There will probably be as many as 2,000 tests made on each of the more important species of timber, and when these are properly collected and discussed it is thought that little will remain undiscovered in regard to the conditions governing the strength of sound timber of all the common varieties. The work has begun with the Southern yellow pines and oaks, six carloads of logs having been received and sawed to date. Since one large stick is cut from each log, and at least two small ones, the relative unit strength of large and small timbers will be determined. The effects of knots, windshakes, seasoning cracks, &c., are also sure to be determined.

Tests of old Timbers.

It is often very desirable to know the strength of old bridge timbers, which, though apparently sound, are more or less cracked along their neutral axes, and have been in service many years. If railroad and bridge engineers choose to send in such timbers full size, just as they have been used in the structure, they will be tested promptly and at a very small cost. A few tests of this kind would go a long way toward educating the judgment of a chief or of an inspecting engineer who may

be charged with the responsibility of deciding when to replace an old structure with a new one.

III. *The Microscopic and Structural Examinations.*

The specimen discs sent to Ann Arbor, Mich., are examined and studied by competent botanists of the University of Michigan, and photographs taken of the structural formation. The article is, however, for the information of engineers and architects rather than of botanists, and hence is mostly taken up with a description of the physical tests. This work will run for many years, if sufficiently supported by public opinion, on which all State work really rests. If it is continued in the same scale of thoroughness with which it is begun, it is impossible to overestimate its value, both to timber users and to timber growers, for one of the ultimate purposes is to learn the conditions most favourable to the profitable growth of the more valuable kinds of timber. Neither are the results of these studies of most immediate use to engineers and architects, but the carriage, waggon and implement makers, car-builders, furniture manufacturers and the public generally are equally interested, since it is only the needs of the public which all these are trying to serve.

ROYAL VICTORIAN INSTITUTE OF ARCHITECTS.

THE following is the text of the presidential address of Mr. George C. Inskip, F.R.I.B.A., at the annual meeting held in Melbourne, July 6, and of which we gave a short summary in a previous number.

The President said :—Following a time-honoured custom I now have the privilege of addressing you. As the last president of the old Institute and first president of the incorporated Institute, I have occupied this chair at a time when great changes have been brought about. Your Council have been called upon during my term of office to undertake a very large amount of work, and to devote a considerable amount of time to the affairs of the Institute, but they have one and all cheerfully undertaken this work, having the welfare of the profession at heart. To show that their labours have not been in vain I would point to the incorporation of the Institute, to the very large increase in the number of our members, to the large amount of interest that has lately been taken in the affairs of the Institute, and also to the anxiety displayed by architects in this as well as the neighbouring colonies to gain admittance to our ranks. New rooms have been leased and furnished, a library started, and upon the table of our reading-room may now be found many of the leading architectural papers of England and of the continents of Europe and America. Many instructive papers have been read during the year, and visits have been paid to several of the principal buildings and manufactories in the city. Our meetings, which at one time were held quarterly, are now held every month, and they have never before been so well attended. The first examination in architecture to qualify for admission as associate was held during the first week in May last, when four candidates presented themselves. It was not expected that a large number of students would come up for examination, and this number must be considered satisfactory to start with. Out of this number two passed. The gold medal was not, however, awarded by the examiners, as they did not consider the work done reached the required standard. The gold and silver medals awarded during 1888 and 1889 were presented at a meeting held on May 4 last. Mr. Annear was awarded the gold medal of the Institute for the best essay upon Gothic architecture, and Mr. Lewis the silver medal for the same subject. Mr. Buick was also awarded a silver medal for the best design for a block of city offices. The reading up required for the essay prizes must have been of great value, and I feel sure that each competitor reaped a vast deal more than the value of the medals in the experience gained by the work done for the purpose of obtaining them. The difficulty of getting suitable dies executed in the colony was the cause of the delay in presenting these medals. Your Council, some eighteen months back, decided to entrust the work to Mr. A. Wyon, the celebrated London medallist, and he has carried out the work in a satisfactory manner, and provided medals worthy of our Institute.

The most important matter that has occupied the attention of your Council has been the Registration of Architects Bill. It was considered that the public interest would be served by provision being made by Parliament for preventing other than skilled persons from practising architecture. For this reason the Registration Bill has been brought forward, and I feel that it ought to receive the support of every right-thinking person in the community. The Bill has been framed upon a liberal basis, admitting as registered architects all who now possess even doubtful claims, so that the future may be made secure against unqualified practitioners. The benefits to be derived from registration would be that in the future all members of the profession would have undergone a similar training, and all

would be registered and form one united body. Mr. R. Best, M.L.A., has kindly taken charge of the proposed Bill, and from his known energy in all matters that he undertakes, I feel sure it is in good hands.

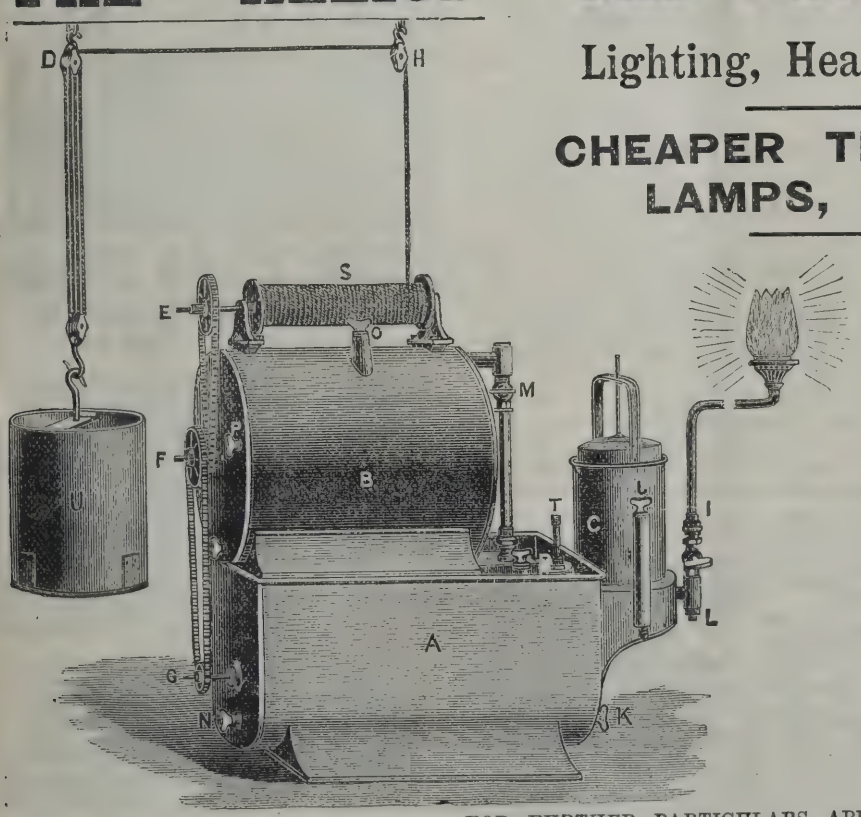
Your Council have under consideration the advisability of endeavouring to induce the Government to call for competitive designs for all public buildings costing 5,000*l.* and upwards. The Government of New South Wales have already adopted this course, but in view of the constant complaints made by our members respecting the mode in which architectural competitions are generally decided, we think it would not be advisable to approach the Government until such time as satisfactory rules regulating competition have been drawn up and adopted. We have been for some time past in correspondence with the various institutes of architects in the other colonies with the object of drawing up conditions that would regulate architectural competitions throughout Australia, and I trust our endeavours may prove successful.

The Builders and Contractors' Association having expressed dissatisfaction with the present conditions of contract, it was decided to meet members of that Association in conference. Two very lengthy meetings have been held, and the matter discussed in a very friendly spirit. As the result, I hope we shall before long be able to lay before you such amended conditions as will be satisfactory both to architects and contractors.

The long-talked-of drainage of Melbourne will, I trust, shortly be taken in hand by the Board of Works. As soon as this undertaking is started there will be an immense amount of work to be done in connecting our dwellings with the main sewers, which work will require the most careful attention of architects. If this part of our sewerage system is not properly and scientifically carried out, the danger to health will be much greater than under our present disgusting system. I therefore think that it is of the utmost importance that a consulting architect should be appointed to advise the Board in all matters relating to buildings.

From the late census it appears that the population of Melbourne has now reached 500,000. The people from the country districts are more and more drifting to this great centre, and there is therefore great need for stringent regulations regarding the erection of dwelling-houses, and the laying out of new streets. Over-legislation is to be deprecated, but a new Building Act is a necessity, framed so as not to unduly interfere with building operations, but an Act that would insure the erection of none but healthy dwellings, and also well laid out and properly drained streets. It is also absolutely necessary that some regulation should be in force that would put a stop to the erection of such death-traps as may be found by the hundreds in the various suburbs in this city. I also think there should be some limit put upon the height of buildings. I think that the width of the street should to a great extent govern the height of the building, as is the case in France, Germany and Sweden. The erection of ten and twelve storeyed buildings greatly increases the risk by fire, and they also dwarf the many well-proportioned buildings in their immediate neighbourhood, and make both appear ridiculous. No matter how skilfully these lofty buildings may be designed (and I must confess that some of them have been cleverly designed and constructed), they most certainly are a disfigurement to the streets. Melbourne has plenty of room for extensions without crowding all its principal buildings in one particular street, so that there is no necessity for such lofty structures, which, in addition to the increased risk by fire, also shut out the sunlight. To have the sunlight excluded for a couple of months in the summer might be an advantage, but for the greater part of the year it is most certainly detrimental to health. While speaking of buildings and building lands, I think it should be made compulsory, where land is being cut up for building purposes, that the roads should be first formed and the drains laid down before any buildings are allowed to be erected. If we look around the various suburbs it will be found that this course has in many cases not been adopted, and after the roads have been made the floors of the dwellings are found below the street-level. In laying out new streets they should also be so planned that good sites may be provided for important public buildings. If this had been done when our present streets were being laid out, our Parliament Houses would not have been shut in as is at present the case.

A great deal has still to be done in the wider streets of the city by the planting of trees. In a climate like ours it is an immense advantage to have plenty of shade. Trees would add greatly to the beauty of our streets, and at the same time have a pleasing effect upon our buildings. Melbourne is far behind the cities of Europe in this matter, and also in the matter of statuary. I trust this will not long continue, but that our principal open spaces and gardens may be adorned by the work of the sculptor.



We have seen by the failure of one of our largest building societies where streets of shoddy houses have been allowed to

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

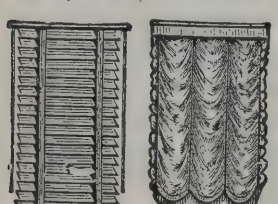
THE INCANDESCENT GAS LIGHT CO., LIM.,

14 PALMER STREET, WESTMINSTER, LONDON.

be erected. The Building Act should be so framed as to put a stop to the erection of such buildings. The housing of the working classes is a matter of vast importance. At present they are compelled in many instances to dwell in the shoddy houses erected by greedy speculators without proper drainage or ventilation. The rent of these death-traps being also excessive, I would suggest to our capitalists the forming of a company for the erection of artisans' dwellings on strictly sanitary principles. I feel sure money so invested would pay handsome dividends, and at the same time a blessing would be conferred upon the working classes.

The Architectural Association lately formed in this city is, I understand, established upon similar lines to the British Architectural Association, for the purpose of giving architectural students and draughtsmen an opportunity of meeting together for mutual instruction. The Association in England is under the wing of the Royal Institute of British Architects, and I am sure this Institute will, so long as the Melbourne Association is conducted on similar lines, be always ready to give it every support and encouragement. I would point out that under the new qualification of probationer pupils and draughtsmen they can now join our ranks and have the privilege of attending our meetings and lectures, and also have the use of our reading-room and library.



A great deal has lately been said about the formation of an Australian Institute of Architects. I feel sure that it would be to our mutual advantage if all the qualified architects in Australia were united in one powerful corporation. I am sure we would gladly meet representatives from the various colonies, and endeavour to bring about this wished-for result.

The collapse of the land boom and the late disastrous strike did much to interfere with building operations during the past year. Notwithstanding these drawbacks, our members have been fairly busy, and several important buildings have been commenced and several completed—amongst others the new Stock Exchange, St. Paul's Cathedral, and the Australian Buildings, all the work of members of this Institute. I have noticed with pleasure that architects have of late given a little more attention to internal and external decorations, and several important buildings have lately been decorated with admirable taste. In a climate like ours it is surprising to me that more attention has not been given by architects to the effects to be obtained by the judicious use of colour in the external decoration of our houses. We are not all possessed with the gift of producing harmony of colour, but I think we might, as lately remarked by Mr. Waterhouse, the president of the Royal Institute of British Architects, endeavour to give more expression to our buildings by the judicious use of colour, and so add greatly to the effect of our designs. We have in these colonies a great variety of beautiful woods, admirably adapted for decorative work, which I am sorry are not more generally used. The prospects of the profession for the coming year are, I think, fairly encouraging, and I trust the present depression may soon pass away. In looking round at the old and dilapidated buildings occupying important sites in our principal thoroughfares, I feel sure they will before long have to make way for handsomer and more commodious structures, giving employment to the architect for many years to come.

We have in this colony a large number of highly-trained and educated architects, but I am sorry to say up to the present the educated architect has not received from the public the encouragement he is entitled to, and which he receives in the older countries of Europe. I trust, however, our endeavours to raise the standard of architectural education may do much to point out to the public the important position the architect holds. I am sorry to say the majority of the public are still contented to employ ignorant and unqualified men. I therefore wish to point out the immense advantage to health and happiness of living in well-planned, ventilated houses, with good sanitary arrangements, and to gain this end it is absolutely necessary to employ educated men to design them. There can be no doubt that a great deal of the sickness in our midst has been caused by the badly-built, badly-drained and badly-ventilated houses that so many people are contented to live in. The scheme of examination lately adopted by the Institute will, I trust, do much to raise the status of our profession and gain for our members the confidence and respect of the public, and show that we are worthy to occupy a leading position amongst the other learned professions. The Melbourne University provides a well-equipped civil engineering school, to which should be most certainly added a school of architecture, so that our young men could obtain a thoroughly scientific training. The worthy Chancellor of the University has always shown himself to be a lover of the noble profession of architecture, and we must look to him to assist us in this matter. I therefore trust that the promised chair of architecture may be established without delay, and that the degree of bachelor of science in architecture may be one of the degrees to be conferred. I also trust, seeing the large amount of wealth that has been accumulated by so many of our citizens, that some one may be found

public spirited enough to endow a chair of architecture and also travelling scholarship for architectural students. The reason so many of the buildings of the Middle Ages are monuments which we now look upon with pride and admiration, and which display the skill of the old architects, appears to me to be that the practice of architecture in the Middle Ages was a profession pursued only by the educated and carried out in what was then the seats of learning—the monasteries. If the practice of architecture in the past was in the hands only of educated men, why should we not in the present day insist that none but educated and trained men should be entrusted with the erection of our buildings, which have so much to do with the health and the happiness of the whole community? The vast amount of influence architecture has always exercised upon the tastes and manners of the people must be admitted by all. It is the architect who gives to future ages the history of society at the time his building was erected. The architect is, and must always continue to be, the educator of the public taste, and it is, therefore, of the utmost importance that those who are to be looked up to as guides in matters of art should be specially trained and educated. We cannot all be a Michel Angelo or a Christopher Wren, but if our architects are specially trained and educated we may hope to hand down buildings that may be looked upon with pride by those who are to come after us.

As a corporate body, the Institute is now placed upon a firmer footing than it ever has been since it was established upwards of twenty years ago, and it is also in a much better position to look after the interests of the profession. I would like to say a few words respecting the duty every member owes to the Institute. We should all remember the object for which it was established, viz.—"The advancement, protection and elevation of architecture as an art, and the cultivation of friendly intercourse between its members." I feel that the Institute is now upon a firm basis, and I trust, gentlemen, you will still continue to take a deep interest in its affairs, and that you will often avail yourselves of the opportunity now offered of frequently meeting together in a friendly way, and so cement that good feeling which should exist between us as professional men engaged in the same work. I would also impress upon you all the advisability and necessity of unity amongst ourselves, and of honourable conduct in all our dealings, and so by our actions show that we are worthy to represent the noble profession of architecture in this colony. Before sitting down, I must thank you for the consideration and kindness uniformly extended to me during my term of office, and also express my best thanks to all members of the Council for the kind manner in which they have upon all occasions assisted me in carrying on, I may say, the laborious work of the past eighteen months. To our worthy hon. secretary, Mr. Billing, I wish to express my sincere thanks for the large amount of time he has devoted to the affairs of the Institute, and the very able manner in which he has assisted me in conducting our business. I must also thank our hon. treasurer, Mr. Purbrick, for his valuable services, and also those gentlemen who so ably acted as examiners at our last examination. Our thanks are due to our late secretary, Mr. D. R. Stewart, and to our present secretary, Mr. Cunningham, who has carried out his duties in a very satisfactory manner. I thank you, gentlemen, very much for the attention you have given to my address. I am afraid I have not been able to say anything new, or have I been able to address you so eloquently as some of my predecessors, but I can assure you I have during my term of office been actuated by one desire only, and that was to maintain the honour of the profession, and to advance the welfare of the Institute; and in the future my single object will be to continue by every means in my power to advance the interest of the noble profession to which I have the honour to belong. I can assure you I shall always look upon it as a great honour to have been considered worthy by my professional brethren to occupy the proud position of President of this Institute.

A vote of thanks was accorded by acclamation to Mr. Inskip for his address.

EDINBURGH WATER SUPPLY.

THE text of the engineers' (Messrs. Gale, Hill & Mansergh and Messrs. Leslie & Reid) report on the proposed additional water supply for Edinburgh and district, has been published in the *Scotsman*. The adoption of the Manor scheme is recommended in point of quality. For 15 million gallons per day the total outlay is set down at 842,440*l*., or by an alternative scheme at 873,005*l*.

Manor Scheme.

The Manor Water, the report states, is a large tributary of the river Tweed, and joins that river about two miles above the town of Peebles. The hills bounding the watershed proposed to be appropriated vary from 2,200 feet to 2,600 feet in height, and the drainage area consists principally of mountain pasture interspersed with rock and *débris* and is practically free from

FOR APPLYING the "SMOKE-TEST" to Drains, Soil-Pipes, Gas-Pipes, &c.
For Fumigating, Disinfecting, Destroying Vermin, &c.

FROM THE LONDON AND SUBURBAN SANITARY SURVEY ASSOCIATION.

"Connaught Mansions, Victoria Street, Westminster, S.W.: April 24, 1890.

"I have now had one of your 'Grahtryx' Smoke-Test Machines in use some time, and find it exceedingly useful and reliable. I inspect several hundred houses annually, and in many of them I find something more than the ordinary smoke tube absolutely necessary, and your machine meets that want. It is, I consider, the most portable, compact, well-fitted, and perfect little machine in the market, and invaluable to all Sanitary Authorities, Engineers, Inspectors, and Plumbers. It should also be of great value to Nurserymen, Plant-growers, Florists, &c., as an exterminator of green fly and other pests. I have tested it in this way in my own vinery, conservatories, &c., and find it most efficient when used with tobacco paper. It should also be of great service to gamekeepers for the rabbit warrens, and for bolting rats. "EDWARD TIDMAN, C.E., M.S.A., and M.P.S.I., and A.S.M."

FROM THE GLASGOW SANITARY PROTECTION ASSOCIATION.

"In reply to your inquiry, I have to state that I have had the Smoke Machine in daily use for over six months (on about 200 different occasions), and have found it very satisfactory, both as regards efficiency and handiness. "GILBERT THOMSON, M.A., C.E."

BAIRD, THOMPSON & CO., *Ventilating, Sanitary, Heating and Consulting Engineers,*

[2] 165 QUEEN VICTORIA STREET, LONDON, E.C.; 24 BATH STREET, GLASGOW.

cultivation. The water in the streams was on the occasion of both visits bright, clear and free from stain. The rainfall is large, and the average available rain of three consecutive dry years will probably be about 26 inches per annum. The total drainage area which can be utilised is 13,720 acres, which, after providing compensation water to the stream, will yield a supply of about 15 million gallons per day for the city. The valley is favourable for the storage of water, and the necessary storage can be provided by the construction of two large reservoirs—one on the Manor Water at Posso, with a top water level of 894 feet above ordnance datum and a capacity of 2,703 million gallons, to be formed by an embankment of a maximum height of 92 feet; the other on the side valley on the Hundleshope Burn, with a top water level of 727 feet above ordnance datum and a capacity of 1,345 million gallons, formed by two embankments, one at each end of the reservoir, of about 52 feet and 38 feet in height respectively. The storage thus provided is sufficient to maintain the supply to the city and furnish the compensation water for a period of 180 days. The surface area of the two reservoirs will be about 450 acres to a drainage of 13,720 acres, or about 1 to 30. The scheme can be conveniently carried out in two sections. The first section would consist of the construction of the Posso Reservoir of the size already mentioned, which will receive the water from a drainage area, including the Glenrath Burn, of 9,310 acres. The supply thus obtained for the city, after providing compensation water, will be about 10 million gallons per day. The second section of the scheme would consist of the construction of the reservoir in the side valley on the Hundleshope Burn, to which there would be a drainage of 4,410 acres, including the drainage to the main stream below Posso, to be conveyed to this reservoir by an aqueduct about one mile in length. The Hundleshope Reservoir will provide the compensation water for the whole drainage of 13,720 acres. The Posso Reservoir would thus be wholly available for the city, and the supply to be obtained would be about 15 million gallons per day. The water would be conveyed from the Manor Valley to Alnwick Hill, a distance of about twenty-five miles, by an aqueduct, consisting of tunnel, cut and cover or built aqueduct, and cast-iron piping across the valleys. The aqueduct would cross the Tweed at Manor Foot, and follow the west side of the Eddleston Valley through the ridge at Leadburn by tunnel, thence alongside the Peebles Railway to the line of the Moorfoot pipe and on to Alnwick Hill. The estimated cost of the first instalment of the work for 10 million gallons per day for the city, including land and contingencies, with tunnel and cut and cover aqueduct for 24 million gallons per day and one line of pipes for 15 million gallons per day, will be 602,364*l.*, and for the second instalment of 5 million gallons per day 240,076*l.*, making a total outlay of 842,440*l.* for the 15 million gallons of water per day. For the purpose of comparison with the other schemes we have made an estimate for a first instalment from the Manor of 8 million gallons per day, which amounts to 568,079*l.*, and the completed scheme for 15 millions by the method of dealing with it will cost 873,005*l.* This includes tunnel and cut and cover aqueduct for 24 million gallons per day as before, but with a pipe to convey only 8 millions per day, and deducting the diversion of the Glenrath Burn, as the Posso drainage alone will give this quantity. The Manor Water is the nearest of the three schemes to Edinburgh, and is one of the best waters to be obtained. It has previously been looked upon as a likely source of future supply for Edinburgh, and was reported upon by the late Mr. Leslie in 1870. The Mid-Lothian Water Company in 1873 obtained an Act for supplying the districts round Edinburgh from this source, with power to sell to the trustees, and the rights of the company were purchased by the trustees in 1874, at the time the Moorfoot scheme was before Parliament. The powers under the Act of the Mid-Lothian Water Company taken over by the trustees have, however, lapsed. The town of Peebles, with a population of about 4,000 persons, obtains a portion of its supply from the Manor Water, near Posso, by means of a cast-iron pipe 7 inches diameter. The quantity required by Peebles from the district is, however, so small that it can scarcely be said to affect the consideration as to the further water supply for Edinburgh and district being taken from the Manor. There should not be any difficulty in making a satisfactory arrangement with Peebles as to their existing supply, or as to any further quantities of water which may be required by that town in the future. If the city should increase so as to exhaust the supply from the Manor Water, additional supplies can be obtained from the upper waters of the Tweed, and with this view the tunnels and the cut and cover aqueducts have been made for a quantity of 24 million gallons per day.

Tweed Scheme.

A scheme for obtaining a large supply of good water can be laid out in the higher reaches of the Tweed valley. The streams proposed to be utilised for the purpose are the Talla Water, with Gameshope Burn, the Menzion Burn and the Fruid Water. The drainage area which can be made available on these streams

is 12,175 acres—the hills surrounding rise to a height of considerably over 2,000 feet—and as regards the Talla the ground is of very much the same character as described for the Manor scheme, but in the Fruid the drainage area is less favourable. The rainfall of this district is large, and in three consecutive dry years may be taken at an average of about 32 inches per annum as available. This upon the drainage area of 12,175 acres will yield a supply of 16 million gallons per day for the city after providing water compensation. There are very good sites for the construction of large storage reservoirs. Two reservoirs would be required—the one on the Talla Water, with a top water level of 965 feet ordnance, to contain 2,473 million gallons, which is provision to receive the water of the Menzion drainage, would be formed by an embankment about 75 feet high, placed across the stream some two miles above its junction with the river Tweed; the other on the Fruid Water, with a top water level of 1,016 feet ordnance, and with a capacity of 1,837 million gallons, to be constructed by an embankment about 62 feet high across the stream about 1½ miles above its junction with the Tweed. The storage thus provided is sufficient to give 180 days of supply to city and for compensation. The surface area of the two reservoirs is 453 acres, to a drainage area of 12,175 acres, or about 1 to 27. It will be seen that the scheme readily divides itself into two parts—the first for adoption would be that including the Talla Water or Gameshope only, but providing storage sufficient for the Menzion Burn. The drainage to the Talla and Gameshope Burn is 5,524 acres, and the supply available for the city after providing compensation will be about 7½ million gallons per day. The second portion of the scheme will include the drainage of the Menzion Burn (to be stored in the Talla Reservoir) and the Fruid Water—the drainage area to these streams is 6,651 acres, and the supply available for the city after providing compensation, about 8½ million gallons per day, making a total supply of 16 million gallons per day. The total length of the conduit from the Talla Reservoir to Alnwick Hill would be about 36 miles. It would pass by Broughton and alongside the Edinburgh Road to Linton, and so on to Alnwick Hill. Where the aqueduct is in tunnel or cut and cover the estimate is for the conveyance of 24 million gallons per day, as in the case of the Manor, so that in the event of further supplies being required, no alterations in this class of work would be necessary. Where the aqueduct consists of piping this can be added to as occasion requires. The estimated cost of the first instalment of 7½ million gallons per day for the city, including land and contingencies, is 584,000*l.*, and for the second instalment of 8½ million gallons per day, 249,000*l.*, making a total of 833,000*l.* for the 16 million gallons per day. When the supply to be obtained under this scheme is exhausted, further water can be obtained from the drainage of the upper Tweed. Though the water of the Talla is of fine quality, the scheme as a whole would not produce such clear water as that of the Manor.

St. Mary's Loch Scheme.

The loch is situated on the head waters of the river Yarrow, which runs through Selkirk. It was at one time looked upon as one of the sources from which Edinburgh and its district might obtain further supplies of water. The scheme was considered by Parliament in the year 1871 and rejected. The elevation of the hills surrounding the drainage is much the same as before stated for the Manor and Tweed schemes. The natural drainage area to the foot of the loch is 27,500 acres, but we propose to divert the Kirkstead Burn, which now flows into the loch, because it discharges too near the outlet and is not required. This will reduce the drainage to the loch to 25,500 acres. The present area of the loch is 723 acres, and is 1 to 35 of the drainage area. There is a little cultivation on the side of the loch, and in some of the valleys on the main tributaries; but, speaking generally, the drainage area may be said to be free from objection, although there is apparently more peat upon this drainage than upon that of either the Manor, the Talla or the Fruid. There had been a rain a few days previous to our visit to the district last October, and its effect was to be seen distinctly in the water of the loch, which was stained. There is a large rainfall in the district, and we find that about 34 inches per annum may be taken as available. This would yield a total supply of 54 million gallons per day, which, after deducting compensation, would leave 36 million gallons per day for the city. We have dealt with the scheme so as to obtain about 15 million gallons per day for the city as in the Manor and Tweed schemes, with which it must be compared. To obtain this quantity of water and to provide the compensation water to the Yarrow, it would be necessary to construct an embankment and relative works at a point on the river a short distance below the outlet of the loch. The necessary storage can be obtained by raising the normal level of the loch 14 feet and lowering it 9 feet, thus giving an available storage of 4,700 gallons, which, under the circumstances, is, in our opinion, sufficient. A considerable area of land would be submerged by the raising of the loch, and a long length of road diversions

A COPY WILL BE SENT POST FREE ON RECEIPT OF CARD.

would be necessary. The estimate for the works to be constructed at the loch, in the first instance, contemplates provision for additions being made to increase the storage at a future time for a further supply of water; such additional works would, however, be small, as the roads would, in the first instance, be laid out with this in view. The total length of the aqueduct from St. Mary's Loch to Alnwick Hill by the proposed route by Traquair and Peebles, is 35½ miles, consisting of tunnel, cut and cover or built aqueduct, and cast-iron piping. The estimated cost for the first instalment of 8 million gallons per day, with one line of pipes, is 765,000*l.*, including land, road, diversions and contingencies, and the construction in the first instance of the aqueduct, wherein tunnel or cut and cover for 24 million gallons per day, and for the additional instalment of 7 million gallons per day, 114,000*l.*, making a total of 879,000*l.* for a supply of 15 million gallons per day. The waters of the loch are at the present time utilised to some extent by the mill-owners having water rights on the river below; but it is probable that satisfactory arrangements could be made with the parties interested in such a way as not to prevent the carrying out of works to obtain a water supply from this district. The estimates have been carefully considered, having regard to the uncertainty of the labour market and other contingencies, and are ample. A tabular statement of the several schemes is appended to the report, showing the drainage areas, quantities of water to be obtained, and the estimated cost of works to Alnwick Hill, including land and contingencies, with the cost per million gallons per day in each case.

A GREAT CHINESE ROAD.

IN a recent memorial to the Emperor of China, the Viceroy, Li Hung Chang, describes the work which has been done to render passable one of the great trade highways of China. The pass leading from Nankow is one of the great thoroughfares connecting Pekin with Mongolia and the southern parts of the empire, and is well known to most visitors to the Great Wall, through which the road passes. The mountainous region in the vicinity was regarded by former dynasties as a barrier against invasion. It is now largely frequented by Mongolian princes and tribute missions visiting Pekin, while it is also the main route for the conveyance of mails and Government supplies to the north and north-western borders of the empire. For more than two hundred years it has never received any repairs on a large scale. Running for a long distance through high hills and precipitous cliffs, it became in summer and autumn a raging torrent, and in winter was a succession of frozen sheets of water which often proved fatal to man and beast. The pass came to be regarded with such dread by all travellers that some improvement in its condition was viewed as an absolute necessity. The great difficulty was one of expense, and as the exchequer of the province of Chihli shows an annual deficit, no assistance was to be expected from public funds. Four years ago a conference of the district officers was held, and inquiries were made amongst the elders and gentry of the neighbourhood, and public opinion was shown to be in favour of levying a contribution on passing animals for the repair of the pass. Offices were accordingly established, and a toll of from two to ten cash was collected upon all camels, mules, oxen, horses, donkeys and other animals passing up and down. Exception was, however, made in favour of horses on Government service returning without a load, as also of all beasts of burden carrying firewood or agricultural implements. But, having regard to the large quantity of stone and other materials required for such a vast work, it was found that the proceeds of the contributions from baggage animals were not large enough to warrant its being undertaken at once, and it was, therefore, thought advisable to carry it on gradually in sections. A commencement was made, and it was not very long before the pass was reduced to a fairly level condition suitable for cart traffic, and then the contributions were considerably increased by imposing a levy upon vehicles. The work that remained to be done was still enormous. Hollows had to be filled up, heights had to be levelled down, and in some places a long detour had to be made and an entirely new road constructed. To defray the cost of keeping the pass in proper repair it is proposed to continue the levy upon animals for several years until the proceeds reach the sum of 2,500*l.*, when it will be discontinued. Similarly, the tax upon vehicles will be continued until 1,000*l.* has been collected. Both of these sums it is proposed to place out at interest to keep the road in good repair.

NOTES ON NOVELTIES.

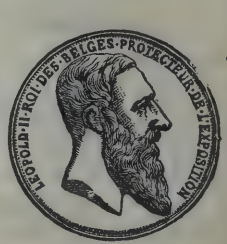
MESSRS. SHANKS & CO., of the Tubal Works, Barrhead, Glasgow, whose name has now so long been associated with excellence in regard to sanitary appliances, have just carried out works at Balmoral Castle. The accompanying illustration

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important Inventions of the Nineteenth Century.

PATENTED IN England, Belgium, France, Germany, Italy.



REGISTERED

TRADE MARK.

PATENTED IN Austria-Hungary, Denmark, United States of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

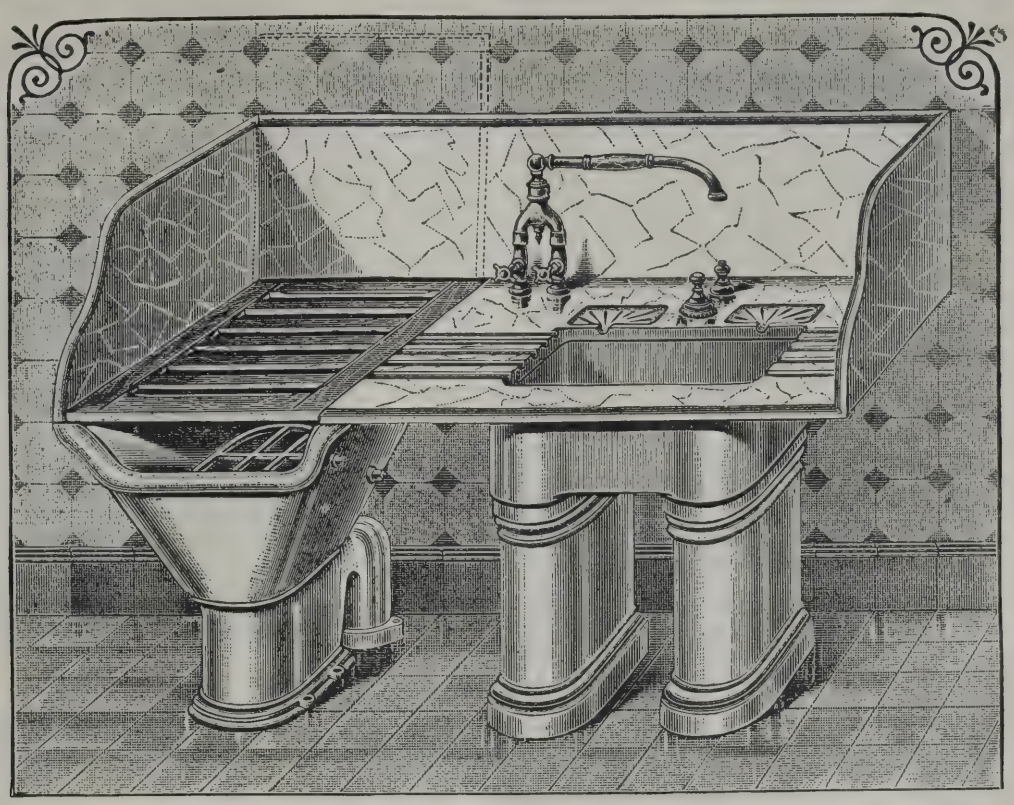
PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1886.

I have had some trials made with the KALLKOLITH during the past few weeks, the results of which are very satisfactory. The KALLKOLITH is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale. J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.



We are pleased to tell you that the KALLKOLITH supplied to us has been fairly tried, and we find that it answers all that you claim for it.

CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

shows a fine specimen of a wash-up and slop-sink, which Messrs. Shanks & Co. have recently executed for Her Majesty the Queen. The design was specially prepared at the request of Her Majesty's agents, and Balmoral Castle is now fitted with two handles shown behind the wash-up sink. The lower grating of the slop-sink is nickel-plated brass, and the upper one is of teak-wood, both being hinged. The wash-up sink, also of white-enamelled fireclay, is fixed on two pedestals of the same

sinks to this pattern. The slop-sink, which, with basin and trap, is made in one solid piece of white-enamelled fireclay, has a perforated rim all round the edge of the basin, and is flushed by means of a large inlet-valve, actuated by the smaller of the material. It is made on Shanks's patent principle, with standing waste and overflow, the waste-pull being the larger of the two handles shown at the back of the sink. The slab and skirting is, by preference, of St. Anne's marble.

PORT OF NESS HARBOUR.

PLANS have been prepared at the office of Messrs. D. & T. Stevenson, Edinburgh, for extensive alterations at the harbour of Port Ness, Lewis. The existing basis was built six or seven years ago by the Fishery Board, at a cost of 6,000*l.* It has proved an immense benefit to the district. Around the Port of Ness the hardiest and most enterprising fishermen on the West Coast reside, and the only natural advantages which they enjoy in the pursuit of their calling are a sandy beach and an eastward bend in the coast, which affords a scanty shelter from the north wind, which brings tremendous rollers down from the Butt. The basin, built of concrete, at the angle in the coast, has sheltered the boats of the whole district in rough weather, but unfortunately the entrance got silted up with sand a couple of years ago, so that boats could enter only at the top of the tide. The West Highland Commission visited the place last April, and were greatly impressed with the character of the fishermen. The proposed alterations are being carried out on the lines of their suggestions. It is proposed to close the existing entrance to the basin, which is a natural opening between two reefs standing out a short distance from the shore. The existing entrance, too, has the disadvantage of being dry at low-water. The new entrance will be formed a couple of hundred feet to the east of the present entrance, and the reefs already mentioned will be used in the formation of a breakwater, which will protect the narrow channel leading into the basin. The new entrance will have 3 feet of water at low tide. The most important part of the scheme, however, is the construction of a new breakwater of concrete, which will jut out from the land in a southerly direction immediately to the east of the new entrance. It will have the double advantage of protecting the entrance from the heavy seas which come from the open, and of forming a quay to which steamers can be brought. It will run out upwards of 250 feet from land. It will be 35 feet wide at the base and have a 20-feet roadway at the top. A parapet 10 feet thick and 8 feet high will run along the outer edge. Outside, 30-ton concrete blocks will be piled along its length to protect it from the action of the waves, and inside it will be finished with a quay face. At its outer end there will be at low tide a depth of 15 feet of water. The improvements will include, of course, the cleaning out of the harbour basin and the making of a roadway from the village, which is just above the basin, to the new pier and breakwater. Under the West Highland scheme 15,000*l.* has been voted for the new works, and a further expenditure of 1,200*l.* was in contemplation for minor alterations, which were to have been carried out independently of the commissioners' scheme.

REGISTRATION OF PLUMBERS.

AT the meeting of the District Council for Hull, East Riding of Yorkshire and North Lincolnshire, held in Hull, Councillor Cohen in the chair, there were present Alderman Fraser, Dr. Mason, D.P.H. (medical officer of health), Mr. A. E. White (borough engineer), Mr. J. Bilson, F.R.I.B.A., and master and operative plumbers. A report of the delegates (Alderman Fraser, Councillor Cohen and Dr. Mason) who attended the plumbers' meeting of the International Congress of Hygiene and Demography, was read, which stated that a resolution had been passed recording the opinion of the Congress that an organised and efficient system of registration of qualified plumbers was essential to the protection and preservation of the health of the community, and that the time had arrived when application should be made to Parliament for powers enabling a Council to take measures for systematically promoting technical education amongst plumbers in all parts of the United Kingdom, and regulating the practice of registered plumbers. At a special meeting of the Congress the master of the Worshipful Company of Plumbers (Mr. W. H. Bishop) also read a paper upon the education and registration of plumbers in relation to the public health; and a paper was read by Dr. Reid upon the education, position and duties of persons engaged in sanitary administration, when, after discussion, the Congress resolved that they cordially approved of the principles of statutory examinations and registration of architects and plumbers.

Alderman Fraser stated that the first meeting referred to was one of the largest held. The meeting was thoroughly representative and most interesting.

On the motion of Mr. G. F. Wells, R.P., seconded by Mr. W. Hodgson, R.P., a vote of thanks was accorded to the delegates, and their report ordered to be entered on the minutes.

A Bill proposed to be introduced into Parliament respecting the national registration &c. of plumbers was then considered, and after a few suggested amendments approved.

Mr. R. H. Kenningham, R.P., was appointed teacher of the plumbers' technical instruction class at the Young People's Institute.

ELECTRIC APPLIANCES.

AMONGST the many types of dynamo machines now in the market, there is one which is well worth noticing which has not yet been made sufficiently well known. It is that made by Mr. Wilson Hartnell, of Leeds and 11 Queen Victoria Street, London. We had the opportunity of inspecting one of these during the week, and were struck at once by the design and well-proportioned working parts. Generally we have noticed the spindles of this class of machinery to be quite the opposite to all engineering practice, and may be considered in most cases analogous to a walking-stick. Mr. Hartnell has struck out in the right direction, and made his dynamos suitable for continuous running. In the case of a dynamo of 5 horse-power

the bearings are 4 and 6 inches long respectively. The spindle is of steel, about $1\frac{7}{16}$ inches diameter. The armature is $8\frac{1}{2}$ inches diameter, and is fitted with an exceptionally large commutator, 7 inches diameter, which enables the machine to run without any sparking and consequent minimum wear. The adjustment of the brushes, which are arranged on the trigger principle, is a novel and convenient method, and is considered another important feature of this machine. They are, we understand, having a good sale for private houses, mansions, factories, &c., and the sale for export is gradually on the increase. Mr. Hartnell has, we find, done a large amount of work, including Wentworth Castle, near Barnsley; the new Town Hall, Dewsbury, &c., and shows an unbroken record of success. We also see that his tender for the lighting of the Town Hall at Bradford has been accepted in keen competition.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

13822. John Hughes, for "An improved paint burner."

13824. Henry Champness, for "Improvements in the construction, also in the mode of fastening or securing when shut, of sliding or other doors."

13852. William Charles Brett, for "Improvements in sashes for window and other purposes."

13914. Thomas Whitaker, for "Improvements in the flooring or roadways of bridges and other structures."

13940. John Neuil Maskelyne, for "Improvements in registering locks for doors."

13983. William Pellam Winter, for "Improvements in and relating to securing moulds in the manufacturing of artificial stone, paving and other uses."

14050. Archibald Langdon Parker, William Harold Brenton and Ludovic Johnston, for "A combination bolt and indicator for doors."

14064. Lawrence Wilson, for "Improvements in and connected with blocks and tiles for paving and flooring, for facing walls and ceilings and for similar purposes."

14096. James Graham Thompson, for "Combination electric lock."

14131. Richard Edwin Hargreaves, for "Improved means or apparatus for applying and securing carpets or other coverings to stairs and steps."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CASSELL, Patent Agents, 37 Chancery Lane, London, W.C.

BRITANNIA TIN AND COPPER WORKS.

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

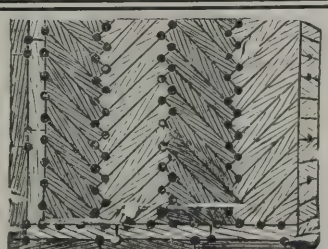
We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,



We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

TRADE NOTES.

THE electric light has been introduced into the Baltic Works, Arbroath, one of the largest of the spinning mills and power-loom factories in the town. This is the first introduction of the electric light into Arbroath.

IN connection with the heating and ventilation of the new Parkhouse School, Arbroath, a gas-engine is to be used, and the hot-water pipes will be placed so that the fresh air must pass through the coils and thus get heated before it passes into the ducts to the classrooms. Before passing through the coils the fresh air has to pass through a screen of Manilla grass, over which a small dribble of water will flow. The air is thus washed as it passes through the screen, the soot, dust and other impurities are kept back, so that only pure air will pass into the school. By the introduction of an air-propeller, the air in the classrooms will be changed five times an hour.

AN offer has been made by Mr. Corbett, M.P., to erect at Towyn massive and ornamental fencing posts and chains between the esplanade and carriage drive. The designs are specially prepared by the Coalbrookdale Co., who are to execute the work for about 400*l.*

THE Portsmouth Town Council have decided to adopt the electric light, and agreed to borrow 60,000*l.* to cover the cost of the site and machinery.

THE *Levant Herald* says that among the applications for concessions for public works now being considered by the Minister of Public Works is one for the lighting of the town of Damascus by electricity. An application for the building of an electric tramway in the port of Smyrna is also at present under the consideration of the Turkish Minister of Public Works.

THE new schools, Loanhead, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

FLUATE

"CLIMAX"
PATENT DIRECT-ACTING TURRET
VENTILATORS
Are the Best in Design, most Powerful, and Cheapest in the Market.
CLIMAX VENTILATING CO., 15 GREAT GEORGE STREET, WESTMINSTER, S.W.

AT the new school about to be opened at Partick by the Govan School Board, the heating and ventilation of the school have received special attention. The rooms are heated by hot-water pipes, and the bath simultaneously with the filling, both being effected on a most economical consumption of fuel. The boiler has been fitted with the Vulcan smoke-consuming apparatus, which by admitting air behind the furnace-bars causes the ignition of the smoke in the flues. Fresh air is admitted to each room through coils of hot pipes, and the vitiated air extracted through separate channels by two Blackman fans, 48 inches in diameter, propelled by a 4 horse-power Otto gas-engine.

TENDERS for the construction of twenty miles of railway from Sofia to Pernik will be received up to September 24. The specifications can be inspected at the Ministry of Public Works at Sofia.

THE subject of jetty accommodation was again considered at the meeting of the Dundee Harbour Board. The engineer recommended the removal of the rocks opposite the west end of the present low-water jetty to a depth of 14 feet below low water of ordinary spring tides, and that the present jetty be extended by 250 feet, at an estimated cost respectively of from 1,500*l.* to 2,000*l.*, and from 6,000*l.* to 8,000*l.* The trustees resolved to invite tenders for the removal of the rocks, but deferred consideration of the proposal to extend the jetty.

THE tender of Mr. Walter Lawrence for works at the Epping Police Station has been accepted, as amended, at 787*l.*, being an increase of 120*l.*

AT the meeting of the joint committees of the Shetland County Council and the Lerwick Town Council, designs of the proposed historical window about to be presented to Kirkwall from Lerwick were exhibited. The window will represent in armour Earl Henry St. Clair, the builder of the castle of Kirkwall.

THE church of Bulmer has been reopened after repairs carried out under the direction of Mr. Fred Chancellor, of Chelmsford, at a cost of about 700*l.* The repairs consist of a new roof, new windows, new floor to the north aisle and new heating apparatus (Grundy's).

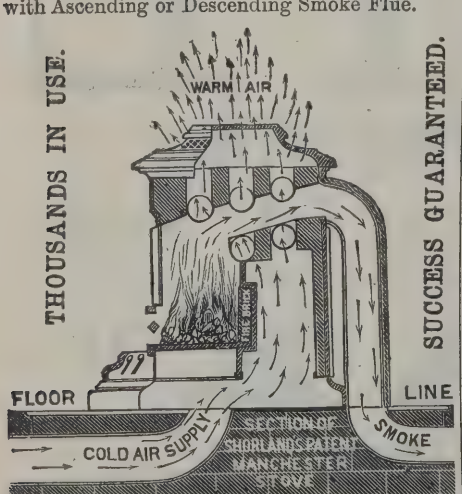
THE contract for restoring the chancel of the parish church, Chapel-en-le-Frith, has been given to Mr. Alfred Hill, builder, of Litton and Tideswell.

THE Edinburgh Town Council have decided to erect a refuse-destructor at Powderhall.

AMERICAN NOTES.

A PALATIAL car has just been built in Massachusetts for the Montreal and Toronto line of the Canadian Pacific. It is 66 feet long; the central "drawing-room," which is turned into a dormitory at night, is 32 feet in length, 9 feet in width, and 10½ feet in height, and is furnished with a dozen easy chairs. The ceiling is frescoed with a beautiful design representing the four seasons, and one of the most striking novelties consists of six bay windows. Besides this apartment there are lavatories—where a quantity of powdered soap slides into the basin of water on pressing a button—a kitchen, a safe for valuables, an "observation room," a private state room, a library with writing desk and medicine chest, and other conveniences. The car is ventilated by compressed air and heated by steam from the engine.

RECENTLY the large Rush Street drawbridge over the Chicago river was turned for the first time by electricity. This, says the *Chicago Journal of Commerce*, is undoubtedly the largest swinging-bridge in the world fitted up for operation by electric power.



GOVERNOR J. V. AYCARDI, of Panama, has tendered for exhibition at the World's Fair a beautiful piece of carved marble, a bas-relief representing the landing of Columbus, which was presented to the State of Panama nearly ninety years ago by the Empress Josephine, who at the same time gave the colossal bronze statue of Columbus, which now stands in Aspinwall.

PLANS have been prepared for an Oddfellows' Temple at Chicago which is to equal Washington's monument in height. The building is to be thirty-four storeys high. The estimated cost is 3,500,000 dols.

A BOSTON paper says:—A young lady architect of Birmingham, Alabama, Miss Sallie Smith, was one of the most creditable competitors for the prize-design of the Women's Building for the World's Fair.

THE Art Department has issued a strong circular urging every architect in the United States to personally assist in an exhibit of American architecture. The manifesto says:—"The membership of the American Institute of Architects includes all the well-known names, in different parts of the country, of men to whom the growth of American architecture, as distinguished from mere building and construction, is due, and of which they are to-day the honoured representatives. It is

P. A. GILBERT WOOD,
175 STRAND, W.C.

through these men that the growth of fine architecture and of the professional and social status of its practitioners in this country during the last thirty years has been developed; and the influence of the work of the Institute on public-spirited laymen of artistic cultivation has been marked."

THE Philadelphia *Builder, Decorator and Woodworker* says:—Buffalo is to have a new seven-storey building for the Builders' Exchange that is to represent four leading styles of architecture. The first storey of stone will be Tuscan, the second and third Doric, fourth and fifth Ionic, and the sixth and seventh Corinthian.

THE *Boston Herald* says:—The Gas Company proposes to make a trial of fuel or water-gas, and has a plant ready for its manufacture and for its distribution over a limited territory.

BUILDING AND BUILDERS.

THE work of erecting the new Surrey County Council buildings at Kingston has been commenced. The cost is estimated at between 40,000*l.* and 50,000*l.*

IT has been decided to close up the old Court-House Police Station in Glasgow, and plans have been passed for the erection of a new police-station in East Clyde Street. The new building will be constructed at a cost of from 8,000*l.* to 10,000*l.*, and is to be three storeys in height.

THE foundation-stone of the memorial church in the township of Brithdir, in the parish of Llanrhaiadryn-Mochnant has been laid by the Dowager Lady Williams-Wynn. The church has been designed by Mr. W. H. Spaull, of Oswestry, diocesan architect.

AT the meeting of the Wednesfield School Board, Mr. Birch gave notice of his intention to move at the next meeting a resolution pointing out the desirability of erecting a new Board school.

AT the Edinburgh Dean of Guild Court the Northern Tramways Company applied for leave to construct a coal shoot at their depôt in Henderson Row. The application was made under a clause of the new Police Act, which provides that in the case of any internal alterations which do not affect the rights of other owners, and which in the opinion of the Court are of minor importance and extent, the Court may authorise the burgh engineer to grant a warrant without a formal petition to the Court. The Court were of opinion, on examination of the plan, that this was not a case in point, inasmuch as the proposed alterations would extend to the making of a door through the outer wall of the depôt into the public street, and accordingly they directed that application should be lodged in the ordinary way.

AT the meeting of the Stafford Town Council the Mayor said that about a year ago the Postal authorities had been memorialised to provide new premises. He understood that plans were prepared for a new building which was in every way worthy of the town. Since then he understood that a hitch had occurred, the point in dispute being a sum of about 200*l.* In consequence of this an alternative scheme was proposed, which simply provided for more counter-room in the present building. This was not what they wanted. They required a new building, which should be more in keeping with the other buildings in the Market Square. He thought if there was only a sum of 200*l.* stood in the way of a new building, it would pay the Council to meet the authorities in committee. A committee was appointed to meet the Post Office surveyor when he came down.

A PROPOSAL has been made that a new medical college should be built in Aberdeen, in place of extending Marischal College, at a cost of something like 17,000*l.*

PLANS for a new police station at Romford have been approved of, and the working drawings and specifications are now being got out.

THE church of St. Cuthbert, a new Roman Catholic church at Heaton, erected from the designs of Messrs. W. H. & J. E. Marten, architects, Bradford, has lately been opened.

PLANS for a new laundry and wash-house for the workhouse at Ongar have been prepared by Mr. Frank Whitmore, of Chelmsford.

The foundation-stone of a Wesleyan chapel at Lichfield, of which Mr. Thomas Guest, of Birmingham, is the architect, has been laid.

THE Government Inspector has condemned Wishaw Public School and recommended the building of a new school. The Cambusnetham School have appointed a committee to confer with an architect as to the improvement of the present building.

THE Bath Town Council have decided to erect a building for the purposes of a technical science and art school to form part of the new block of Municipal Buildings.

ELECTRIC LIGHTING

Works:—London, Manchester, Kidsgrove and Chiswick.

IT has been decided to purchase a site, at a cost of 750*l.*, adjoining the County Court-house, Braintree, for the erection of a police station, at an estimated cost not exceeding 4,000*l.*

VARIETIES.

THE Middlesbrough Gas Committee recommend the obtaining of powers to borrow 50,000*l.* for the proposed extension of the gasworks.

THE Darlaston School Board have appointed a committee to select a site for the erection of new schools, complaints having been made of the state of St. George's Schools as unsatisfactory

THE estimated expenditure for the repair and maintenance of the Edinburgh streets, pavements, &c., is 44,260*l.* Last year the estimate was 43,115*l.*, and the actual expenditure 41,750*l.* For the formation and maintenance of sewers and drains the estimate is 16,985*l.* Last year the estimate was 13,600*l.* and the actual expenditure 12,411*l.* 12*s.*

THE Town Council of Bridgwater have appointed Mr. Francis Parr, of Barnstaple, town surveyor.

IT is proposed to erect a police-station in Green Lane, Patricroft, near the Barton Union Vagrant Ward.

THE Fish Market, Aberdeen, is to be extended eastwards along Commercial Road for a further distance of 250 feet. The full length of the market will then be 1,000 feet.

THE damage done by the recent floods on the catchment area of the Simla Waterworks has, the *Indian Engineer* says, proved to be more serious than was at first anticipated. Nearly all the bridges are blocked by trees and débris, so that the water is now running over the top of them. Eight bridges have been entirely washed away, and the road destroyed in several places. Over 400 feet of piping has disappeared, while in places where the road is broken, lengths of from 20 to 40 feet of piping are hanging in mid air. This unexpected accident has emphasised the necessity of providing a more complete water supply for Simla.

THE Post Office authorities are looking out for a site or building suitable for a new post-office at Tipton.

THE Works Committee of the Aberdeen Harbour Board have agreed to extend the present wooden wharf at Market Street across the top of Albert Basin, at a cost of 1,530*l.* The wharf is for the accommodation of the timber trade.

THE engineers, MM. Zscokke and Seifert, appointed by the Basle Civil Court to investigate the causes of the railway accident which occurred in June last, ascribe the disaster to the defective construction of the bridge at Moenchenstein.

THE Town Council of Inverkeithing have resolved to approach the North British Railway Company with a proposal for the construction of a new harbour and dock at that port.

THE cost of laying a second pipe in connection with the Lintrathen Waterworks between Pitnappie and Dundee, and of relaying upwards of six miles of the original pipe in the Valley of Strathmore, in which numerous bursts have occurred since it was put down, is estimated at between 60,000*l.* and 62,000*l.*

A GOVERNMENT inquiry has been held at Guildford, at the Town Hall, as to the application of the Town Council to borrow 35,000*l.* for sewage-working.

A LOCAL GOVERNMENT inquiry has been held at Colne into the Local Board's application to borrow 7,987*l.* for works of private street improvement. The application was unopposed.

THE Brighton Guardians have been authorised to expend 5,500*l.* on the purchase of a site for a board-room and offices.

THE WEYMERSCH PRIMARY BATTERY.

THE installation of electric light in country houses and detached places generally has always been attended with insurmountable difficulties. We may enumerate them as follows:—First cost of plant, say, dynamo, gas or other engine for driving, items which would bring the expenditure to start with to not less than 250*l.* for an average installation. This is by no means the end of the outlay. It would be necessary to provide an engine-house (with greater risk of fire) and a man to take care of the engine; nor would the peace and quiet of the rural retreat be improved by the monotonous noise of machinery. No wonder that under these circumstances the householder in the position we have described prefers gas, and has concluded long ago that there is no way out of the difficulty. It is here that the subject of our notice, the Weymersch battery, provides a happy solution. The Weymersch battery takes the place of the engine and dynamo, and the cost of the battery is less than one-fourth of that for machine-plant to effect the same purpose, and it dispenses with the incidental troubles we have referred to. The Weymersch battery plant can be supplied complete

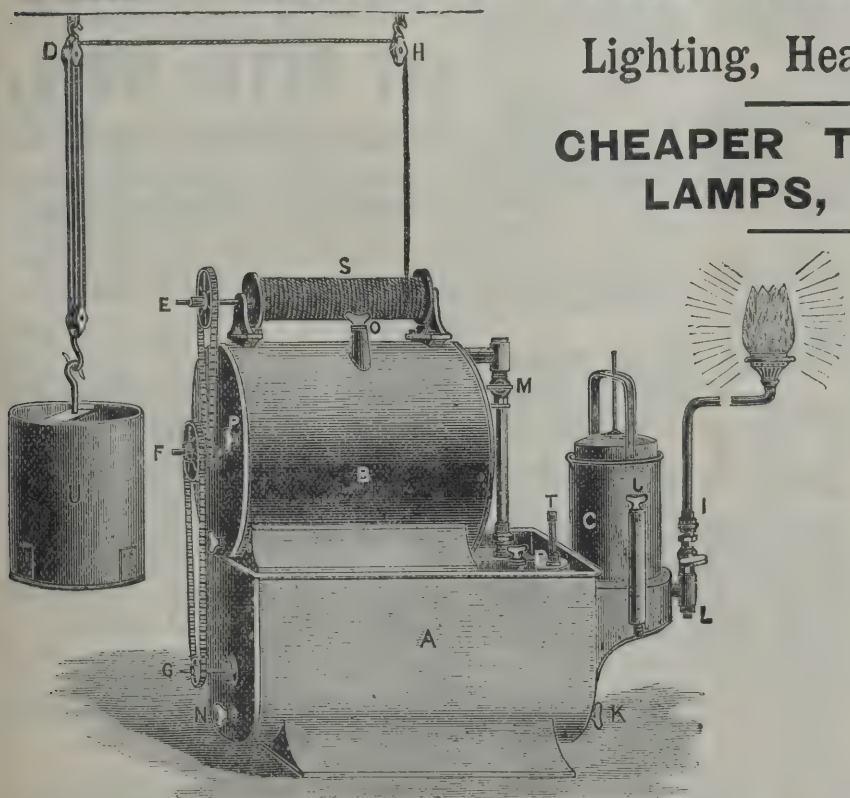
GROVE WORKS, BATTERSEA, LONDON, S.W. (Export Office:—15 Victoria Street, Westminster) **& BACHELOR'S WALK, DUBLIN.**

(including primary and secondary batteries and wiring the house for about twenty-five lamps) for about 100*l.*, and the cost of working is thus summarised by Messrs. Alabaster, Gatehouse & Co., the well-known electrical experts :—"Taking a good 16-candle power incandescent lamp as requiring 50 watts to heat it to that luminosity, we find that the cost per hour (for materials) to keep such a lamp in action is in the one case 1·275*d.*, and in the second 0·9*d.* A slight reduction in the price of materials, which would probably result from buying them in larger quantities, would practically mean that a 10-candle power lamp—a convenient standard for comparison—would cost (for materials) one-halfpenny per hour." Thus 10-candle power lamps can be maintained for 5*d.* per hour ; but, assuming a higher figure, say 7*d.* per hour, to cover expenses of carriage of materials, &c., it will be seen that the cost of maintenance of ten 10-candle power lamps would be 32*l.* per annum, assuming that they are used on the average three hours per day throughout the year. The primary battery, as shown at the offices of the syndicate, is large enough to charge accumulators for a twenty to twenty-five light installation, and consists of fourteen cells. The carbons, two in each cell, are placed in two porous pots, side by side, in strong depolarising solution, and the zincs, large thin plates, are hung outside in a weak acid solution—half-pint acid to one gallon of water. The solution can be drawn off by taps and syphons for recharging. The carbon plates never wear out, and the zinc plates are easily renewable. It is at once seen that the necessaries for the maintenance of the battery are extremely simple, merely a solution which can also be supplied in the form of a chemical salt to be dissolved in water, a small quantity of commercial hydrochloric acid supplied to the consumer, and a fresh supply of zinc plates as the old ones wear out. In cases where the total number of lamps are required to be in use at one time, the lamps may be run direct from the battery ; but where, as is usually the case in domestic electric lighting, all the lamps, or only one or two, may be required at any hour of the day or night, some form of storage is necessary. This is best effected by secondary cells, the battery then being used in the place of a steam or gas-engine and dynamo. These in conjunction form the complete plant, to which may be attached a ventilating fan, driven by the power of one primary battery. This is illustrated at the offices of the company, as also at the offices of the Blackman Ventilating Company, Fore Street, E.C., with most satisfactory results. Another development is the driving of water pump (together with electric light), to be seen in operation at Messrs. Merryweather & Sons, Long Acre, W.C. Installations on the Weymersch system have been provided (in addition to the offices of the company) at Staines, Eastbourne, Horsted-Keynes, Tetbury, Sutton, Dulwich, and at Park Lane, St. James's. It will certainly inspire confidence in the Weymersch battery if we inform our readers that since 1888, when it was first introduced, the directors have been experimenting on and improving the invention, so that now the manipulation of the battery is so simple that any gardener can easily manage this, there being, moreover, nothing in the battery to get out of order, and now they submit it to the public as nearly perfect as a primary battery can be. We have no doubt that it will find a large field open to it, and without competing with dynamos under ordinary conditions, will stand alone for domestic lighting in detached places.

Architects should be especially interested in securing for their clients this inexpensive system of electric lighting, more particularly as its actual working is sure to give satisfaction. The offices of the Weymersch Syndicate, Limited, are at 2 Victoria Mansions, Victoria Street, Westminster, S.W., and a personal visit of inspection is invited to see the battery in operation.

A "TITAN" CRANE.



ON Wednesday several engineers visited Messrs. Stothert & Pitt's works at Bath, when some interesting experiments were made with a 50-ton block-setting "titan," which the firm has just completed for the Admiralty Harbour works, Peterhead. The machine is believed to be the largest travelling crane yet made. The working load of the "titan" is 50 tons, the proof load being 62½ tons ; the radius from the revolving centre to the extreme position of the load is 100 feet. In other words, the "titan" will pick up a test-load of 62½ tons and swing it round the circumference of a circle 200 feet—say 67 yards—in diameter, the weight lifted being equal to that of a goods locomotive and tender. The machine is capable of lifting and lowering the load, slewing or revolving round the centre through a complete circle, and racking the load in and out horizontally. The whole machine is also self-propelling. The material of which it is composed is mild steel of a very high quality. It was designed by Mr. William Matthews, under whose constant supervision it has been constructed. The gearing was designed

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

THE INCANDESCENT GAS LIGHT CO., LIM.,

14 PALMER STREET, WESTMINSTER, LONDON.

by Mr. Walter Pitt, and the work was carried out and erected under the direction of Mr. P. K. Stothert, the managing director of the firm. Some details of the uses to which the "titan" is to be put may prove interesting. The Lords Commissioners of the Admiralty are constructing at Peterhead, N.B., a great harbour of refuge, of which Sir J. Coode is the engineer. The breakwater of this harbour will be formed of artificial blocks of concrete weighing upwards of 50 tons each. The machine in question is intended for placing the blocks in position; it will stand on the end of the finished portion of the breakwater, and the blocks will be brought to it in trucks; the machine will then lift them up and swing them round to the front end, when they will be run out horizontally over the water and lowered down and set by divers. The roughness of the sea at Peterhead and the great depth of water, necessitated the adoption of an exceptionally massive and strong design of breakwater, requiring for its construction blocks of great size, and hence the necessity arose of procuring a block-setting "titan" of dimensions and power considerably exceeding ordinary machines. The tests applied were in every respect satisfactory, and the huge machine will shortly be conveyed to its destination. The railway carriage from Bath to Peterhead will cost close upon 1,000*l*.

NOTES ON NOVELTIES.

THE patentee for the patent improved "interlocking" blocks for floors, wall-facings, &c., is Mr. Edward Gregory, of 6 Clarence Villas, Richmond, Surrey, late surveyor, War Department. The blocks may be made of wood or any other material suitable for the purpose required, and of any regular four-sided figure. These wood-flooring blocks comprise three styles—first, those suitable for floors of public schools, warehouses, barracks or other structures subject to hard wear. Each large block in this design interlocks with, and is in turn interlocked by, six adjacent blocks. Each small block holds down, and is in turn held down by, two adjacent blocks. Secondly, blocks similar to those above mentioned, except that they are laid diagonally. This design may be thought more suitable for corridors, aisles of churches and the like. Thirdly, blocks intended for higher-classed work, such as that in entrance-halls and vestibules to mansions, public buildings, libraries, &c., and which may be made in two or more kinds of superior woods, giving a contrast of colour.

THE CARPENTERS' STRIKE.

A CORRESPONDENT writes:—"Kindly permit me to state facts. The present strike of carpenters and joiners is the most unjustifiable that we have ever had. They are paid 9*d*. per hour and, as a rule, work 52½ hours per week, making 1*l*. 19*s*. 4½*d*., and are paid overtime extra at 1*d*. first hour, 2*d*. per hour up to 8 o'clock, and half-time extra 8 to 12 and double time after 12 P.M. Now they want 10*d*. per hour and to work 47 hours, making 1*l*. 19*s*. 2*d*. per week. What can be their object to work for 2½*d*. per week less? I answer this is their motive—because they well know that 47 hours per week is a loss to the master builders in numerous ways, such as the idleness in which their horses and carmen, &c., will be kept, and the slow progress business would make, so they think the masters will give in and allow them to make overtime of 5½ hours, which will make 52½ hours per week, and they ask 1*s*. 3*d*. per hour from 5 to 8 P.M., and 1*s*. 8*d*. per hour from 8 P.M., and on Saturdays overtime to commence at 12 noon and to be paid 1*s*. 8*d*. per hour; if allowed to work 5½ hours overtime per week at 1*s*. 3*d*. per hour will add 6*s*. 10½*d*. to the 1*l*. 19*s*. 2*d*., making a total of 2*l*. 6*s*. 0½*d*. for 52½ hours. Observe, they are willing to work any number of hours, although their principal argument is that if they work only 47 hours per week it will enable a reduction to be made in the ranks of the unemployed and give them greater recreation and more time for study. This overtime is their great point, and they know it, hence their principal argument falls to the ground. The public generally are not aware that this increase upon 52½ hours will add at least 17 per cent. to the labour value of the weekly wages over that which is now paid, and when they fully understand this to be the case I fear they will by every means reduce their wants for such exorbitant labour value. It is not only the carpenters and joiners that are craving for the increase; the present strike is only the forerunner for all other mechanics and labourers. It is shameful that so many thousands of families who were once happy and comfortable are brought to starvation and ruined by this strike. Why don't the heads of these families act like men and leave the union, and stand up as a body and go to work and set at defiance the promoters of this strike, also the pickets, the "catspaw," and also you non-unionists act like men without fear and trembling? The joiners of London are driving a large amount of their trade into the country, and will also set the

foreigner thinking how he shall introduce into the market better joiners' work than he at present makes. I strongly advise not to sneer at the American or Swedish joinery; they can improve. Englishmen cannot rule the world. John Bull can be beaten. Do not let me hear an English mechanic run down the Irish boycotting. What is the difference between this and picketing? I trust the law will shortly step in between and put a stop to this cursed intimidation of the honest and hard-working man."

TENDERING IN PENNSYLVANIA.

A RATHER interesting point has been decided in the Supreme Court of Pennsylvania. There is a statute in that State requiring contracts for public work to be awarded to "the lowest responsible bidder." Not long ago, says the *American Architect*, bids were invited by advertisement for certain public work, and in the advertisement the right was reserved "to accept or reject all bids as the best interests of the city may demand." All the bids received were rejected, and another advertisement was made. The lowest responsible bidder under the first advertisement claimed the contract, in accordance with the statute, which says nothing about reserving the right to reject all bids, and makes no exception to the provision that the lowest responsible bidder must be awarded the contract. The question appears to have been whether the first advertisement was an absolute invitation for proposals, such as the statute contemplated, or only a provisional one, conditioned upon the decision of the proper authorities that the bids received under it were such as the best interests of the city demanded. The Supreme Court upheld the latter view, and decided that no responsibility was incurred to the lowest bidder, under the first advertisement, by the rejection of all the bids. This is not the first time that contractors have met with disappointment through too great reliance on their interpretation of the meaning of this particular statute. Some years ago a large public contract was awarded to a person who was not the lowest bidder. The contractor who made the lowest offer sued to have the contract awarded to him under the statute. He proved that he had ample capital and long experience in the business, and claimed that he was the lowest responsible bidder and was entitled to the work. The defence was that the commissioners who had in charge the matter to which the contract related thought that they had reason to believe that the lowest bidder was intemperate, and that he had been guilty of dishonesty and attempted bribery in connection with another public contract. It was proved that these impressions in regard to the bidder were groundless, but the Supreme Court held that, if they had been well founded, the commissioners would have been justified in considering that a man who had been guilty of such misdemeanours was not a "responsible bidder" within the meaning of the statute, whatever his financial standing might be, and while it expressed astonishment that the commissioners should have given credence to such rumours about a man without ascertaining the truth by inquiry, it held that their discretion was absolute, and that, in the absence of fraud, their decisions were not subject to review by the courts.

THE MONIER BUILDING SYSTEM.

SPECIMENS of material, models and illustrations of works completed under the Monier building system have lately been exhibited at 183 Upper Thames Street. The patent consists of a certain combination of iron and cement, based upon the fact, first discovered by M. Monier (and fully worked out by the well-known engineer, Mr. Wayss, of Berlin), that the expansion and contraction of iron and cement are equal, and that they likewise possess great affinities, uniting firmly and forming one solid, indestructible mass. The iron, being embedded in the cement, does not oxidise, nor will atmospheric changes affect the affinity between the iron and the cement. Among the most important advantages possessed by the Monier system are, that buildings so constructed are fire and waterproof, while at the same time a maximum amount of strength, combined with lightness and elegance, is attained. Great economy is also claimed for it, the patentee stating that it can easily compete in price with, and in many cases is far cheaper than, any other material. The system has been employed extensively in Germany and other parts of the Continent, and seems to be applicable to an almost endless variety of purposes; and we are told that it has stood the severest tests of fire, water, extreme pressure, &c. The last use the company have applied their process to is the construction of street and railway bridges, tunnels, and sewer and drain-pipes, and their success in this field appears to have been at least equal to their other operations. A very simple machine for the construction of drain-pipes up to 5 feet in diameter is on view at the above premises, and which, it is claimed, turns them out cheaper than stoneware, and practically as strong as cast-iron.

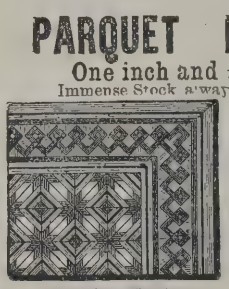
REGISTRATION OF PLUMBERS.



A SPECIAL meeting of the District Council for Ulster was lately held in one of the committee-rooms of the Municipal Buildings, Belfast. The meeting was well attended, Lisburn, Bongor, &c., being represented as well as the Belfast District. Professor Thomas Sinclair, F.R.C.S.E., in the absence of the Mayor, was called to the chair. The business before the meeting was the consideration of a Bill drawn up by the Worshipful Company of Plumbers, London, to define and legalise the registration system. The various clauses were fully discussed, and the principle of the Bill strongly approved of. Mr. Wm. M'Cammond, J.P., T.C., chairman of the Improvement Committee, was called upon to preside whilst a vote of thanks was tendered to Dr. Sinclair for his dignified conduct in the chair. Arrangements were also made to have the subject brought more fully before the public, who will be the chief gainers by the proposed changes.

THE BIRMINGHAM TOWN HALL.

THE architects and contractors, says the *Birmingham Post*, as well as the Estates Committee, are to be congratulated upon the expedition with which the works determined upon at the Town Hall have been carried through. Their magnitude may be realised when it is stated that they involve a cost of about 10,000*l*., 7,000*l*. of which is for structural alterations. In a fortnight's time the interior of the hall has to be ready for the Festival rehearsals, and there will then only remain to be done some minor details in connection with the corridors, &c. Already the scaffolding required for the interior work has been removed, and although the organ-front has to be completed, and one or two finishing touches have to be made, the effect of the redecoration can now be judged of. The Estates Committee, for some mysterious reason were very secretive with regard to the designs for the redecoration, and the City Council were afforded no opportunity of inspecting the drawings. A number of designs were submitted by firms of decorators, and one prepared by Mr. John Taylor, of Five Ways, was accepted, subject to modifications suggested by the architects (Messrs. Cossins & Peacock). The result will, we believe, upon the whole give general satisfaction. The treatment is entirely different from that which it has replaced, and which, it will be remembered, was of a very elaborate character. The present design is strictly Roman-Grecian, and in that respect is in perfect harmony with the architecture of the building. There is very little ornamental painting, but greater importance has been given to the structural mouldings and enrichments, which are in themselves of a very beautiful character. The prevailing hues in the upper portion of the hall are a tint of yellow known as "maize," with lines and panels of terra-cotta, a considerable surface of cream or vellum, with the occasional relief obtained from turquoise blue, and a very large employment of gold, both in lines and upon the decorative moulding. The effect is to reflect a large amount of light, and to add considerably to the apparent size of the hall. To enter more fully into detail it may be stated that the walls beneath the galleries are of Pompeian red, and the iron columns of olive green. The base line of the gallery front is of cream tint, with a line of turquoise, and the vertical "stiles" cream, with a terra-cotta panel. Between these the open ironwork is of gold, which is shown against turquoise wood panels in lieu of the red cloth which was formerly used, and which collected a large amount of dirt. The wall-spaces immediately above the side galleries are treated in flat colour, which will be sufficiently broken by the spectators seated in front when the hall is in use. The projecting piers beneath the Corinthian pilasters are of a soft neutral-toned terra-cotta, and the wall-spaces between them of a sage or ash-leaf green, merely relieved by lines of terra-cotta, marking out a bold panel. The moulding which forms the base of the pilasters is principally of cream, with small longitudinal panels of turquoise, small gold pateræ, and an occasional gilded line. On the wall-spaces between the bases of the pilasters is a cream or vellum band, with a very graceful line of old gold colour, broken at intervals into a kind of upward curl. Above this vellum is a more emphatic band of terra-cotta, with upright fluting of lighter toned red, gold and black. The pilaster shafts are of cream, with no shading or picking out of colour, the flutings making their own effect of light and shade; while the acanthus leaf capitals are of gold, with the turquoise blue occurring again by way of relief in the deep background. The wall-space beneath the windows is in two tones of full maize yellow with horizontal lines of terra-cotta. This, however, is only temporary, it being proposed that these spaces shall hereafter be filled with cartoons, in the preparation of which an opportunity may be afforded to the students of the Municipal School of Art. The lighter maize tint is carried up and around the windows, but the mouldings of the latter have been amplified by a strap-line of terra-cotta forming a pediment over each

window top, and terminating with a scroll at the bottom of each side. The "reveals" or sides of the window recesses, have decorative terra-cotta panels, with gold mouldings, and the window bars are painted golden yellow. The resulting effect is very soft and bright. The eye next ascends to the frieze, in which cream and gold are again largely used, with a somewhat emphatic band of terra-cotta, with stencilled enrichments of a paler tint, and the insertion of a small lion's head in black and white over the capital of each pilaster. Sage green also appears by way of relief on the "soffit" between the gilded bracket-like structures, technically known as "modillion blocks," which support the chief moulding. In the treatment of the ceiling flat enrichments are very sparingly used, and, indeed, there is little need for them, as the mouldings themselves are a very fine decorative feature. In the cove, turquoise is very happily used for the inner flat surfaces of the bold square panels which there occur. The moulded rosettes in the centre of each are of cream and gold, and there is a border of Greek key pattern in red on cream ground to each panel. The honeysuckle and other similar mouldings on the ceiling are gilded, as well as the pierced iron-work of various openings, the shades of which cannot be distinguished from black colour. A prominent feature in the ceiling are some very large floral rosettes, in connection with which a very happy treatment has been followed. The main tint is cream, with the back of the curling leaves gilded, and a golden suffusion introduced around the depths of the central bud. Blue, gold and terra-cotta are employed in the decoration or the minor panels, with conventional honeysuckle ornament occasionally introduced on the flat. Around the large wheel-like panels, where a little extra relief is needed, a pink ribbon of cable design is painted, and in some of the longer panels there is depicted a Greek staff, encircled with leaves. There are a few Greek key mouldings of the ceiling, which, like the flutings of the pilasters, are sufficiently distinct by their own shade when coloured with a cream tint, and no picking out of them has been attempted. Altogether the treatment of the ceiling, while chaste and simple, is remarkably effective, and does the designer great credit. In the decoration of the organ-pipes gold, cream and silver are largely used, with horizontal bands of turquoise blue, and various enrichments on the larger surfaces, in harmony with the general decorative scheme.

The effects of the structural alterations of the hall are now apparent. We believe it will be agreed that they enhance the appearance of the approaches, and that they will minister to the safety, convenience and comfort of the audiences which will assemble in the building. The architects have shown not a little ingenuity in the rearrangements which have been effected, but at the same time they are alterations in the direction of simplicity where previously very clumsy devices had been adopted. Instead of cramped-up entrances at the front of the hall, with opposing currents of people, and scarcely any accommodation for persons waiting for the calling up of their carriages, it will be found that the hall can be both entered and quitted with comfort. We doubt if any one will be able to detect that about 6 feet have been "pinched" from the floor of the hall. The street door opens immediately into an entrance-hall measuring 65 feet from right to left, and about 12 feet deep. The architecture of this apartment is Classical, with square lintels, appropriately decorated, fluted pilasters, coffered ceiling, and cornice of modillion blocks. The walls are dadoed with brown and white alabaster, and the upper portion will be coloured a warm cream tint, forming a suitable introduction to the still warmer yellow scheme of decoration in the great hall. It was at first proposed that the dado should be of polished Anglesey marble, but it was found that alabaster was the only material which could be worked in the limited time which was available. The floor of the entrance-hall is asphalted. In the centre of the apartment seven marble steps, 16 feet wide, ascend between projecting piers to the outer swing-doors of the great hall. The doors are of oak, glazed in the upper portion with stained-glass, and having a central panel beautifully carved by Mr. Bridgman, of Lichfield. The doors are in three sets, and are divided by handsome bronze shafts supplied by Messrs. Winn & Co. At a space of 5 feet 6 inches further inwards are a second set of swing doors, so that no draught should be occasioned to the occupants of the hall by persons entering or leaving. The stairs to the floor, although the central, are not the only feature of the new entrance lobby. Right and left of the flanking piers are staircases, 5 feet 6 inches wide, leading straight to the basement, where the ladies' and gentlemen's cloakrooms open out of a common apartment. Further to the right and left are recesses, with movable counters, for ticket-office purposes, and to the extreme right and left, although still directly facing the street, are the new stairs to the great gallery. With one turn to right or left these staircases will lead to a very cleverly-arranged intermediate floor or crushroom extending over the entrance hall below. It, of course, is not so lofty, but is amply spacious, and in the daytime derives light from windows in the pavement of the peristyle. Further, although constructed beneath the

great gallery, it is fireproof, and is not devoid of decorative features, in the way of a bold balustrade protecting the top of the stairs, and fluted mouldings to the supports. A passage at each end leads past the lavatories to widened staircases giving access to the great gallery either at the centre of each side, or at the top corners. In both instances stone stairs have been substituted for wood. The whole rearrangements at this end of the hall have removed elements of danger both as regards inadequate means of exit and highly combustible wooden structures. In connection with the cloakrooms in the basement spacious lavatories have been constructed, with light and air derived from areas beneath the pavement in Congreve Street and Ratcliff Place.

It is scarcely necessary to repeat the particulars which we published a short time since of the alterations at the northern end of the hall. They include the construction of stone staircases leading direct from the entrance lobby to the orchestra at each side of the organ, the substitution of a stone passage behind the organ at the level of the peristyle in lieu of a wooden platform with movable trap, and the building of two independent stone staircases from the peristyle to the roof, so as to allow of access by firemen in case of any outbreak in the timberwork. These latter staircases have been provided by the removal of two columns, which were simply the decorative filling of corner spaces at each side of the organ recess. The old stone has been used in carrying out this work, and there is no detriment to the appearance of the hall. In addition to these improvements there has been provided an elaborate system for introducing warm fresh air into all parts of the hall. The air finds entrance down shafts from the peristyle, and, having been washed by a spray, is projected by two large Blackman propellers into newly-constructed ducts, 5 feet square, running round the hall, and in which the air is brought into contact with a system of hot-water pipes. Thence, having been warmed, it passes behind an inner wall, through various gratings beneath the side galleries, and through almost innumerable piercings in the flooring of the galleries themselves. The heating and ventilating system has been carried out by Mr. Wilson Phipson, of London, under the supervision of the architects, Messrs. Hart, Son & Peard supplying the pierced iron gratings, which are of a partly decorative character. The contract for the general structural work was taken by Messrs. W. & J. Webb, of this town, to whom great praise is due for the rapidity with which it has been executed. It is satisfactory to note that there has been no accident to the workmen who have been engaged on the undertaking, although there has been a large amount of scaffold-work, especially in connection with the redecoration, for which no fewer than 1,300 poles and between 500 and 600 scaffold-boards were brought into requisition.

HIGHER-GRADE SCHOOL, WOLVERHAMPTON.

AT the meeting of the Wolverhampton School Board on Friday last, the Chairman moved the adoption of a recommendation of the General Purposes Committee that, subject to the consent of the Education Department, the plans prepared by the Board's architect (Mr. T. H. Fleeming) for the higher-grade school, to be erected on the Newhampton Road site, be adopted, and that tenders be obtained for the consideration of the Board. He said that the plans had been carefully considered in committee, and he believed they would be found to be very complete. There would be a main building, consisting of a central hall, surrounded by classrooms for boys and girls, giving accommodation for 600 desks, though for the purpose of calculating the cost there would be accommodation for 727 pupils; and contiguous to the main building there would be the science and art section, consisting of laboratories, lecture theatre and art room. Near to would be another block for the technical section, and on the other side rooms for cookery and laundry teaching. A covered playground and gymnasium would be provided, and in addition there would be other rooms, one of which would be used for pupil teachers' instruction. He did not think that was an opportune time to go into the question of cost, which had been before the sub-committee from the outset, and a calculation was made based upon information received from other towns where higher-grade schools existed. Still, when the committee came to go into the complete scheme for this higher-grade school, the fact was forced upon their minds that the cost would be very much in excess of the original estimate made by the committee, an increase consequent upon the more elaborate scheme which the Board had seen fit to adopt. He should be sorry even to guess what the cost would be until the tenders were obtained. After some discussion about withholding information about the cost, the Chairman said the architect's figures were for the main building about 8,500*l.*; art and science section, 3,400*l.*; cookery and laundry section, 750*l.*; technical section, 400*l.*; covered playground and gymnasium, 1,000*l.* The Rev. Canon Davies said that would amount to 14,050*l.*, independently of

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane W.C.

the site, which had cost about 1,200*l.* There was an increase over the original estimate of about 6,000*l.* He thought 14,000*l.* was an enormous sum to spend on such a school. He was of opinion that it would be better to get tenders before sending the plans to the Education Department. The Chairman denied that there was an intention to mislead the public as to the cost of the schools, and held that the architect's figures were too high. It would be impossible to give up any part of the plans without mutilating the scheme. On a vote being taken, it was decided to send the plans back to the General Purposes Committee for revision.

ABERDEEN RESERVOIRS.

IT is proposed to construct new reservoirs and filter-beds in Aberdeen. That some improvement is urgently demanded is plain from the following extracts out of a report that has been prepared by a special committee:—It was not the sub-committee's intention, nor their desire, to dwell at considerable length on the various impurities, vegetable and animal, which detracted from the purity and quality of the water supply, but there were one or two of a serious nature which, in their opinion, invested the question of filtration with such importance that they considered they would be failing in their duty if they did not call attention to them. They referred more particularly to the presence of eels, leeches and other water reptiles in the water, and to the existence of low animal organisms in the shape of fungoid growths in the interior of the aqueduct. For many years complaints had been numerous among the consumers in various parts of the town about the presence of animal and other impurities in the water, and more especially of eels and leeches, and during the last year these complaints had been much more frequent, giving rise to grave apprehension of their being on the increase. A startling revelation was made during the progress of the works of repairing the old reservoir at Mannofield in the end of last year, when it was found on running the water off that the entire bottom of the reservoir was one seething mass of leeches. Steps were, of course, taken to destroy them, but their presence there in such overwhelming numbers could not be other than alarming and a matter for anxiety as to the utter inadequacy of the filtering arrangements at Invercannie to prevent their appearance in the water supply. For years the fungoid growth had been found during the summer months more or less thickly along the inner surface of the aqueduct for many miles below Banchory, and it had only been by the most unremitting vigilance by those in charge that it had been kept down and periodically removed. Every year, and sometimes twice a year, men were sent in along the entire length affected, and the surface of the aqueduct carefully scraped and washed clean. Unless carefully watched, and if allowed to remain until decomposition was beginning to set in, the work of cleaning became a difficult and objectionable task, the stench being such that the men were unable to remain for any length of time within. The prevention of such impurities in or contamination of the water was a matter for their most urgent consideration, and a question that must be immediately faced.

After frequent meetings and making a thorough investigation into all the details of the water-supply system, the committee unanimously came to the conclusion that additional filter-beds must be provided, so that the water might be delivered to consumers in a pure state, and entirely free from the presence of foreign bodies or other disturbing matters.

It might be urged by some that sewage contamination should be dealt with by the authorities representing the places where the pollution was created, and that that must be done in a considerable degree was true. It would, however, be a tedious and protracted undertaking to compel them to carry into operation the necessary works, and even when done, all experience went to show that both in the style of works carried out and in the superintendence and attention which they might afterwards receive, they would fall very far short of being so complete or effectual as to render the water pure and fit for domestic consumption. At present the evil, although not of alarming magnitude, was of sufficient importance to warrant a grave apprehension as to what might be the consequence to the inhabitants of Aberdeen, if an epidemic of cholera or typhoid fever were to break out in any of the villages of Upper Deeside, which now discharged their sewage into the river. Being agreed that the existence of such impurities must be prevented at all hazards, the question naturally arose how to intercept and free the water-supply from them. To that the reply was that a complete system of filter-beds must be laid down, so as to insure a thorough purification of the water. The existing filter-beds at Invercannie were laid down in 1866 by Mr. Simpson. They are circular in shape and two in number; have a total available sand area of 2,460 square yards, and are capable of filtering, when in good working order, about 1,700,000 gallons daily.

The sub-committee are of opinion that both the storage and filtration accommodation is utterly inadequate and practically useless, and that the state of the water supply demands a large extension of this accommodation, in order that the water may be delivered to the inhabitants in that state of purity which they have a right to expect. The extension required to put the existing works into the state of efficiency that is necessary would doubtless cost what might be considered a large sum of money, but it was an expenditure which they were bound to face, and after all it was not such a large sum when compared with what towns of a similar or even of a lesser size than their own had expended in the purifying of their water supply. The ground adjoining the existing works at Invercannie, and lying between the private road belonging to the Council and the Burn of Cannie, was eminently suitable for an extension of the works, and the sub-committee proposed to acquire the whole of that ground. To the west of the existing reservoir there was ground sufficient to make two large settling reservoirs; but although they were of opinion that the whole of the ground should be acquired, at present they did not recommend that more than one settling reservoir should be constructed meanwhile. This reservoir would be capable of holding nearly 35,000,000 gallons, which, together with the existing settling reservoir, would be equal to seven days' supply. As the consumption increased, until the maximum limit they were empowered to draw from the river, and which the aqueduct was capable of carrying, was reached, the storage could be extended by constructing the additional reservoir, when a total storage of 9½ days will be available. To the east of the reservoir, and contiguous to the existing filter-beds, the ground is admirably adapted for laying down new filter-beds, and it is proposed to construct six filter-beds here. Five are sufficient to filter the quantity of water required for the daily supply, but another is necessary to allow the full quantity of water to be filtered while any of the other beds is being cleaned, which requires to be done about once a month. There is sufficient ground to the south and east of the filter-beds on which a further extension can be made. The committee do not anticipate, however, the construction of more than one filter-bed in addition to the six described; but it is desirable to purchase the ground on account of its position as an available area for conducting, cleaning and other operations, and also on account of its value as a source of sand—the most important element in the construction and maintenance of all filter-beds. The committee recommend accordingly that power should be taken to acquire the land, and to construct the works they have already described, the cost of which is estimated as follows:—

One additional storage reservoir	£28,000
Land for two storage reservoirs	4,000
Six additional filter-beds	27,400
Land for same, and extension	1,600
Contingencies	6,100
Total cost of lands and works	£67,100

In conclusion, the committee say that, although at the first glance this sum may appear large, the accommodation at Invercannie is so inadequate and obsolete that the works cannot be thoroughly equipped to meet the requirements of the present day without this expenditure. They have gone most carefully into every detail, with the light of the most recent and best experience of the country to guide them, and, after giving the question most earnest consideration, are unanimously of opinion that the whole works ought to be carried out; otherwise the water-supply of Aberdeen cannot be kept pure and efficient.

ASPHALTE PAVEMENT.

A RECENT bulletin of the United States Census Department shows that in 1889 the total amount of asphalte produced in the United States was 51,735 short tons, valued at 171,537 dols. Of this California produced 47,968 tons and Utah 3,163 tons; almost the whole of the remainder came from Kentucky. Nearly 500 tons, however, were obtained from the gilsonite of Utah, and this is said to be the purest yet found, containing 90 per cent. of bitumen in the crude mineral. The California deposits of Ventura country are in a bituminous rock, containing 24 per cent. of bitumen and about 64 per cent. of silica, with oxide of iron and calcium carbonate. The prices range from 8 dols. to 10 dols. per ton. The bituminous rock of San Luis Obispo and Santa Cruz is valued at 2·50 dols. per ton at the mines. The greater part of the supply of asphalte comes from Trinidad and the deposits of Seyssel, in France, and Val de Travers, in Switzerland. Cuba furnishes some excellent asphalte, and large deposits are reported to exist in Tabasco, Mexico, though little has been shipped from this place. The importation of asphalte into the United States may be said to have commenced in 1869, when 185 tons, worth 5,632 dols., were imported. This quantity increased until in 1889 61,952 tons, worth 138,163 dols., were imported. Of this 52,881 tons

were from Trinidad. The imports of bituminous limestone from Neufchatel and Seyssel amount to about 200 tons annually; and about 150 tons of a similar material are imported from Hanover and Brunswick. During 1887-90 about 6,000 tons of bituminous limestone were imported from Sicily and used in street paving. The number of square yards of Trinidad asphalte pavement laid in the United States is now 6,803,054. In 1880 there were 106,838 square yards down, and in 1890 1,875,000 square yards were laid. About 72 per cent. of all the Trinidad asphalte imported is used for street paving, 24 per cent. is used in asphalte block and tiles for pavements, and 3 per cent. for roofing. The total area covered by bituminous limestone pavements in European cities is given as follows:—Berlin, 681,486 square yards: London, 360,000 square yards; Paris, 357,360; other cities, 300,000—total, 1,698,846. This is equivalent to about one-fourth of the area covered by asphalte pavement in the United States.

PUBLIC BATHS FOR BATLEY.

THE Batley Corporation have decided to erect some public baths in the town, and the Local Government Board has sanctioned the borrowing of the money which will be required. Building operations will be commenced forthwith, according to plans prepared by Mr. Walter Hanstock, architect, Branch Avenue, Batley. The site selected for the baths is on the Market estate, between Cambridge Street and Wellington Street. The building will front to Cambridge Street, and its dimensions will be 126 feet by 134 feet. For the most part the premises will be one storey high. The external appearance will be plain, but substantial; and whilst there will be no extravagant ornamentation inside the building, the best materials are to be used, and there will be a general look of comeliness about the place. There are to be two swimming-baths, first and second-class. The latter will measure 91 feet by 49 feet, with a water measure of 75 feet by 30. Dressing-boxes will be arranged on three sides, and above these there is to be a spectators' gallery, because it is intended that in this bath swimming matches and entertainments shall take place. The first-class swimming-bath is to be on the Wellington Street side. There will be a water measure in this of 63 feet by 25 feet. Arrangements have been made for twenty second-class and ten first-class slipper baths, with necessary appurtenances. The provision of a set of Turkish baths, with a cooling and dressing-room, a first hot-room, second hot-room, a small third hot-room, and a shampooing-room, will no doubt be much appreciated by many people of the town. Glazed bricks are to be used very extensively, and this will entail a greater expenditure than would otherwise have been necessary. However, it is estimated that the cost will come within the sum of 10,000*l.*, which it was originally decided to spend over the baths.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

14253. Albert Deacon, for "Tools for making hinges."

14267. Samuel Handscombe and William Smith, for "Improved apparatus for increasing the draught of fires for consuming smoke, particularly applicable to domestic fireplaces."

14271. John Poat and Charles James Watts, for "An improved form of boiler for hot-water circulation or other purposes."

14339. Herbert Drake Whiteley, for "Improvements in wearing surfaces for floors and other objects."

14375. Henry Harris Lake, for "Improvements in door-checks and closers."

14406. Robert Waugh, for "An improved spring bolt."

14435. Thomas Bailey, John Lowe and Thomas Fletcher, for "Improvements in padlocks."

14476. John Trimming, for "A combination instrument for the use of architects and surveyors, called the 'Architect's Desideratum.'"

14507. Warren Howard Taylor, for "Improvements in and relating to locks."

14560. Robert Adams, for "Improvements in springs for doors and analogous articles, and in adjustments and checks for preventing slamming."

BRITANNIA TIN AND COPPER WORKS.

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. BUILDING AND BUILDERS.

HERNE CHURCH, interesting as the place where Ridley first recited the "Te Deum" in English, has, says the *South-Eastern Gazette*, at length received the finishing touches of the restorer. The north aisle, with its eastward continuation, the Milles Chapel (divided from the aisle by the old rood screen which should be elsewhere), has been re-roofed in place of the old lean-to, and the balance of the fabric restored. The woodwork of the new roof is made of Jarrah wood, from Western Australia, which presents at once the appearance of rich dark

mahogany, there being no waiting before the wood tones down. The contract has been carried out by Mr. H. B. Wilson, of Canterbury, who restored the nave of Herne Church in 1853, and in the interim has restored fifty-three Kentish churches.

THE conditions for contracts for the improvements in the channel of the Carraca at Cadiz have been issued. It is calculated that two million cubic mètres of mud will have to be removed in order to leave a depth of 8 mètres and 40 centimètres at low water. The different proposals of contractors will be examined on October 20—each proposal being accompanied by a deposit of 3,200*l.* Each estimate for the work to be "in price per mètre" for extraction and time required, but it is stated that not more than four or five years will be conceded. Work to be commenced within six months of the adjudication.

THE trustees of the Hospital of St. Mary Magdalene, Ripon, have obtained the sanction of the Charity Commissioners to erect six additional almshouses on the south side of the old chapel. The plans and specifications have been prepared by Mr. John Oldrid Scott. The whole of the work has been entrusted to Mr. Abel Trees, of Ripon, builder, who will commence the buildings at once, so as to get them roofed in before winter.

VARIETIES.

SOME of the wire and iron works in Warrington had to be closed last week on account of the extraordinary heat. The workmen refused to labour until the weather became cooler.

IT is proposed to erect a Roman Catholic church at the foot of Haley Hill, Halifax, as a memorial of the late Rev. Father Wake.

MESSRS. WEIGHTMAN & AMERY, architects and contractors, of Charlestown, Natal, are the successful competitors for a new church at Utrecht, Transvaal. Nine plans and specifications were sent in. The church is Gothic in design, with tower and steeple. It is to be built of stone, with tracery windows, and to have leaded lights filled with cathedral glass. The contract price is 8,493*l.*

ABOUT 10,000 crowns have now been subscribed in Sweden for the proposed John Ericsson monument.

A PAPER on "Retort Charging and Discharging Machinery for Gasworks," by Mr. Henry O'Connor, will be read at the meeting of the Society of Engineers on October 5.

TO make Portland cement proof against freezing, Herr Reinhofer, an Austrian engineer, recommends crystallised soda dissolved in water. In one experiment he used 1 litre of Portland cement to 1 litre of lime and 3 of river-sand. He mixed this with 1 kilo. of soda dissolved in 3 litres of water. The mortar thus made was exposed for fourteen and a half hours to cold of a maximum intensity of 31·5 deg. C., and was then put into a furnace for three hours. At the end of that time the "set" of the cement was found to be perfect.

THE Trustees and Directors of the Halifax Mechanics' Institution have decided that they do not feel justified in taking the responsibility upon themselves of building a technical school, but are willing to support the Technical Instruction Committee of the Corporation in attaining so desirable an object, and are prepared when the occasion arises to recommend to the members of the institution that the building be disposed of and the proceeds be devoted to the purposes of technical instruction in such a way as the members may resolve, the Mechanics' Institution to have the power of appointing a proportionate number of the members constituting the committee of management.

THE Port Glasgow Town Council have accepted the sum of 5,000*l.* from an unknown donor for the erection of public baths and wash-houses for the use of the inhabitants.

THE Earl of Portsmouth's mansion at Hurstbourne Park, near Whitchurch, Hants, which was destroyed by fire some time since, is to be rebuilt from plans which have been prepared by his son, Viscount Lymington, M.P., who will take up his residence there when the work has been completed.

THE Baptist Chapel, Kent Street, Portsea, was destroyed by fire on Tuesday morning. It was insured for 3,000*l.*

MR. DEACON, C.E., reports that the Cheshire shaft of the aqueduct tunnel under the Mersey has been sunk as deep as it is desirable to sink it until the tunnel from the Lancashire side has advanced further. On Saturday night the shield stood at 166 feet 9 inches from the centre of the Lancashire shaft, being an advance of 5 feet 1 inch during the week.

THE special sub-committee appointed by the Town Council of Glasgow to inquire into the cost and financial results to the Improvement Trust of erecting workmen's dwellings and a "family home" on vacant ground at the corner of High Street and Rottenrow have issued a report. The cost of the buildings is estimated at 18,100*l.*, and the cost of the site is recorded at 5,962*l.*, being 24,062*l.* in all, the annual interest on which sum

is put down at 931*l.* It is thought that an annual revenue of 853*l.* would be got from the shops and houses, and that the "home" would yield annually 360*l.*, after paying all expenses, the total revenue being thus 1,213*l.*, leaving an apparent surplus over the annual charge of 281*l.* The committee recommends that the principle of the trustees themselves erecting the buildings be affirmed by the general committee.

THE Deganwy estate, situated midway between Conway and Llandudno, and comprising about 280 acres, chiefly fronting the sea, was sold by auction on Tuesday. The property belonged to the late Mr. Joseph Evans, of Haydock, colliery proprietor, who, it was stated, spent 68,000*l.* on its purchase. The property was purchased by Mr. Thomas Barker, high sheriff of Carnarvonshire, for 29,000*l.*

AMERICAN NOTES.

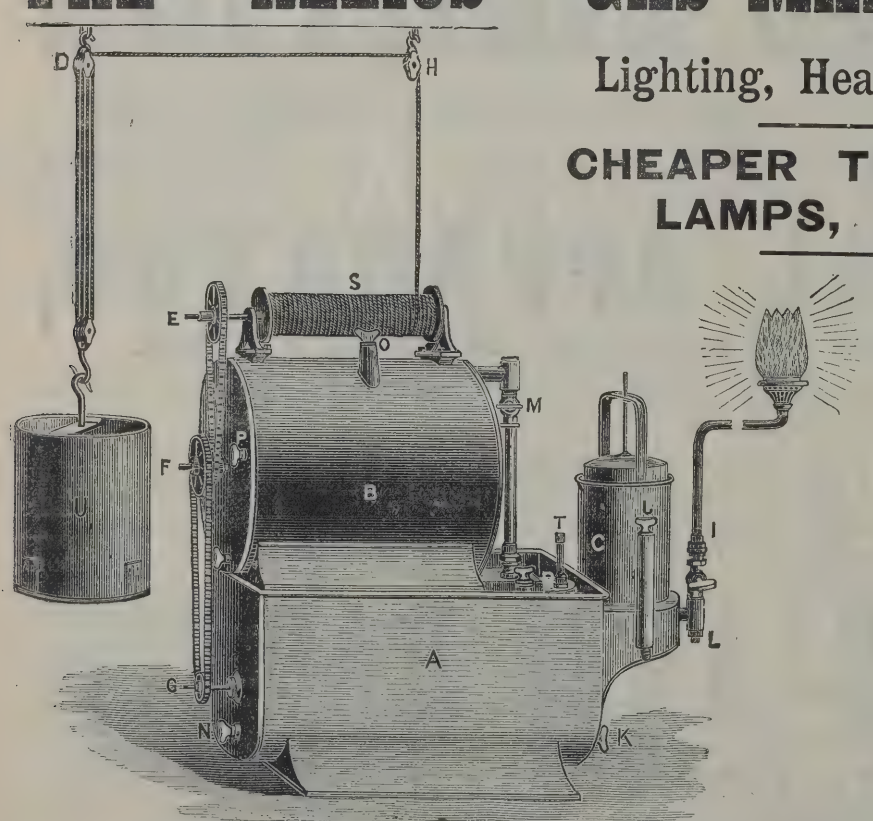
IT is proposed to hold an international engineering exhibition in connection with the Chicago Exhibition of 1893. The project has been well received and approved in England, Scotland, Ireland, France, Switzerland and Germany.

A STEAM hammer, weighing 125 tons, has been erected at Bethlehem, Pa. The pit for the foundation was 58 by 62 feet, and the foundation-walls are 20 feet in height. The anvil is built on a foundation of stone and timber, and has some 1,600 tons of iron in it. The top of the hammer is 90 feet above the floor of the shop; the steam cylinder is 4 feet in diameter and 16 feet 6-inch stroke. The piston-rod is 16 inches in diameter and 40 feet long. The hammer head is of cast-iron, the block being 19½ inches by 10 inches by 4 inches, and the die is of steel. The weight of the working parts is 125 tons and the fall 16½ feet.

THE Niagara Falls Tunnel is now excavated for 1,175 feet, or about one-third of the entire length, which is 3,530 feet.

A BUSINESS building 550 feet high is proposed for Lower Broadway, New York. The site would be next to the Washington Building, and the area to be covered would be about 162 feet on Broadway by 200 feet deep to Greenwich Street. The architect is Mr. F. P. Dinkelberg, and the estimated cost is 4,000,000 dols. There would be twenty storeys in the office building and six more in the tower, which latter would rise 260 feet above the roof of the building proper and 550 feet above Broadway. There would be 1,000 offices, with an average floor-space of 300 square feet for each office. The tower itself would contain offices. In general design it would follow the new type of architecture, in carrying the weight on a thoroughly tied and braced skeleton of iron and steel beams and posts, leaving the minimum weight upon the walls.

PROFESSOR W. S. CHAPLIN, Professor of Engineering at Harvard University and Dean of the Lawrence Scientific School, has been elected Chancellor of Washington University at St. Louis. Professor Chaplin is forty-three years old, a native of Maine and a graduate of West Point. In January 1877 he was appointed Professor of Civil Engineering in the Imperial University of Japan at Tokio, remaining until July 1882. While occupying this position he was called to take charge under the Minister of Public Works of the roads, railways, canals, docks, harbours and other engineering works of the empire. He resigned his position in Japan in 1882, receiving the Imperial order of "Meiji" of Japan in recognition of his distinguished services. On his arrival in his native country Professor Chaplin became engineer of construction for the New York and New England Railway, then constructing its double tracks from Franklin, Mass., to Hartford, Conn. In September 1883 he accepted the appointment of Professor of Mathematics in Maine College, from which place he was appointed in July 1885 Professor of Engineering in Harvard University. Some time ago a gift of 100,000 dols. was made to the Washington University by an unknown person, to be held in trust by three prominent citizens until a chancellor should be selected. The selection of Professor Chaplin releases the gift.



THE Detroit Dry Dock Co. have now in course of construction what is said to be the largest, most convenient and strongest dry dock on the entire chain of lakes. The interior dimensions of this large wooden dock will be 380 feet long on the keel blocks, 55 feet wide at the bottom and 91 feet at the top. In the construction over 2,000 piles have been used, and they are driven over every 6 feet square throughout the entire area of construction. As a preliminary undertaking there was formed a puddle wall 8 feet wide and back 12 feet from the edge of the dock, after piles had been driven; the filling-in was done with blue clay puddled in a concrete mass, and packed in from a depth below the level of the river-bed up to the surface ground, and connected to the outer cribs outside of the dock gate. The bottom of the dock is driven closely with piles, on which are mortised 12 by 12-inch frame logs; a sheathing of inch-pine is then laid, on which the flooring of 12 by 4-inch oak laps over the seams of the sheathing. The pumping apparatus

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

FOR FURTHER PARTICULARS APPLY TO

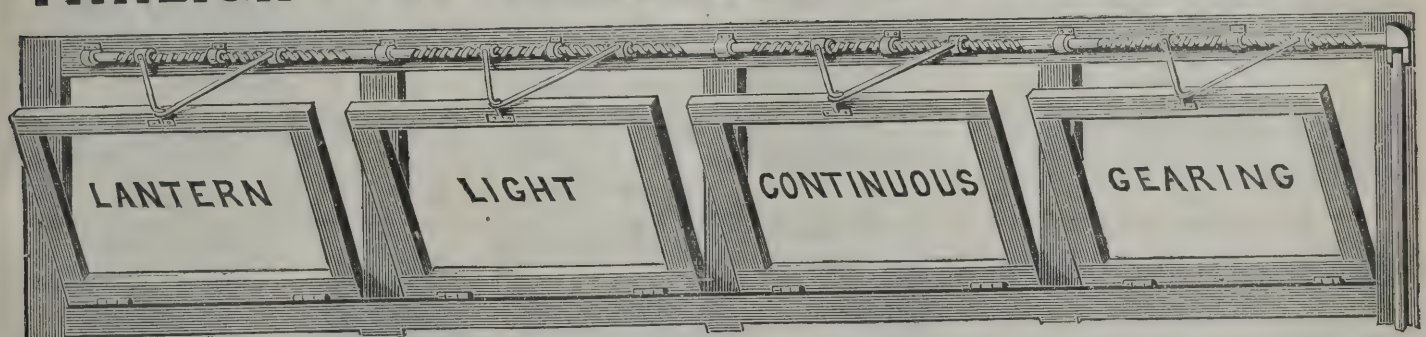
THE INCANDESCENT GAS LIGHT CO., LIM.,

14 PALMER STREET, WESTMINSTER, LONDON.

is unequalled on fresh water. The dock will contain upwards of 3,500,000 gallons of water, and a pump well 35 feet deep, 25 feet long and 11 feet wide, built with 12-inch oak timber, is supplied by a brick tunnel from the dock, 5½ feet in diameter. To lower the level of this chamber there are two centrifugal pumps, each having a discharge of 30 inches in diameter, and worked by two separate Westinghouse engines of 150 h.p. The steel pontoon gate which is now being built is 80 feet long, 20 feet deep and 12 feet wide, weighing 75 to 80 tons, and requiring about 160 tons of concrete and scrap iron to ballast.

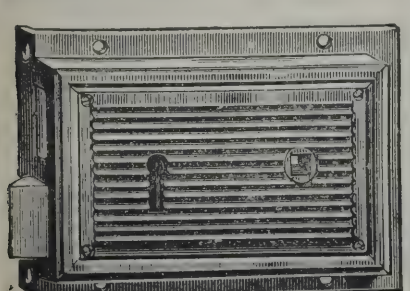
THE requirements of some of the buildings of the Chicago Exhibition have been underestimated. The building for manufactures will be increased by roofing over the inner court provided. The plans for the Government building will probably have to be changed. This structure was not to cost over 400,000 dols., but the tenders for it range from 410,500 dols. to 775,000 dols., not including the architects' fees, superintendence, &c. The proposition of M. Eiffel to build a tower has been rejected. It seems he only intended to prepare plans, leaving the responsibility for the foundations and erection with the Commission. Three Chicago contractors have offered to put up a tower 1,200 feet high, to cost 2,000,000 dols.

THE NEW CINCINNATI AND NEWPORT CANTILEVER BRIDGE.

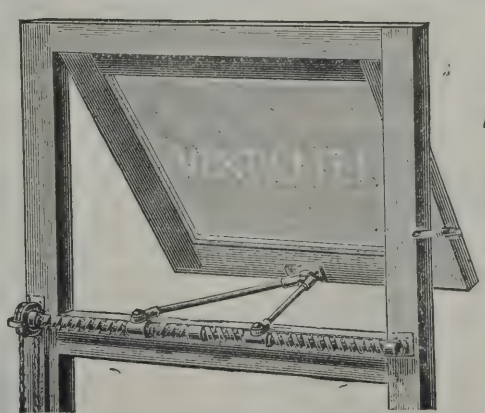


THE new steel cantilever bridge between Cincinnati, O., and Newport, Ky., was given over to traffic on August 29. The bridge is a highway bridge, and affords the first sufficient facilities for the convenient and rapid transportation of passengers, street cars and waggon freight between the two cities which it connects. From the south-east corner of Broadway and Second Street, in Cincinnati, there extends south-eastwardly a solid viaduct, enclosed with heavy masonry walls and paved with granite blocks for a distance of 282 feet. This is succeeded by a span of steel viaduct 150 feet in length, a steel truss of 108 feet, another span of steel viaduct 81 feet in length, and a steel truss of 162 feet, reaching to the lofty masonry pier at the edge of the Ohio River. At this pier begins the true cantilever construction. It consists of two end spans of 252 feet each, and a central span, crossing the channel, 520 feet in length. Then follow two spans of steel trusses of 254 feet each, plate girders 55 feet in length, 213 linear feet of steel viaduct, a plate girder bridge of 50 feet, crossing Eglantine Street, and 333 feet of masonry viaduct, paved with granite, leading to the corner of York and Taylor Streets, in the city of Newport. The total distance, from the corner of Broadway and Second Street to the corner of York and Taylor Streets, is 2,916 feet, or a little less than three-fifths of a mile.

The bridge consists of a roadway of 24 feet clear width, bearing two street railway tracks, built especially for electric cars and of extra strength; and of two sidewalks, each 7 feet in clear width. The lower chord, at the centre of the span over the channel, is 108 feet above mean low water, and the steel towers at each end of this span rise 85 feet above the masonry, and 190 feet above the foundations of the piers. The superstructure is supported on nine piers containing about 12,000 cubic yards of masonry, not including that in the viaduct and in the approaches. All the great piers in the river are placed on a foundation of solid rock. It is planned to carry, with perfect safety, a moving load of 85 lbs. per square inch, with additional provision for road-rollers, electric motors, and other heavy concentrated loads. The grades are all easy. In size, length and strength the bridge is said to be surpassed by but one highway bridge in America, and that is the East River bridge, connecting New York and Brooklyn. The bridge was designed and constructed by the King Iron Bridge and Manufacturing Company, of Cleveland, O. This company took the contract for its complete construction, including the purchase of right of way in Cincinnati and Newport.



ASPHALTE AS A SUBSTITUTE FOR MORTAR.



A PAPER was read by Mr. W. C. Ambrose before the American Society of Civil Engineers on "Asphalte in Building." He stated that the Ventura Division of the Southern Pacific Railroad was built for several miles along the bluffs facing the Pacific Ocean. The material of these bluffs is sand and gravel between strata of soft rock, soluble in water; and though the violence of the waves is moderated by a group of islands about 22 miles off shore, at high water of spring tides, with south-west gales, they wash away the bank very rapidly, and protection for the road in some places was soon found necessary. The seashore at the foot of these bluffs is generally covered two or three feet deep with boulders and sand over the hard bed-rock; hence the use of piling was impracticable. The rise and fall of tides, which would

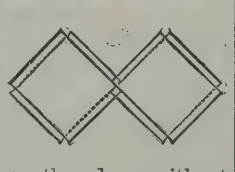
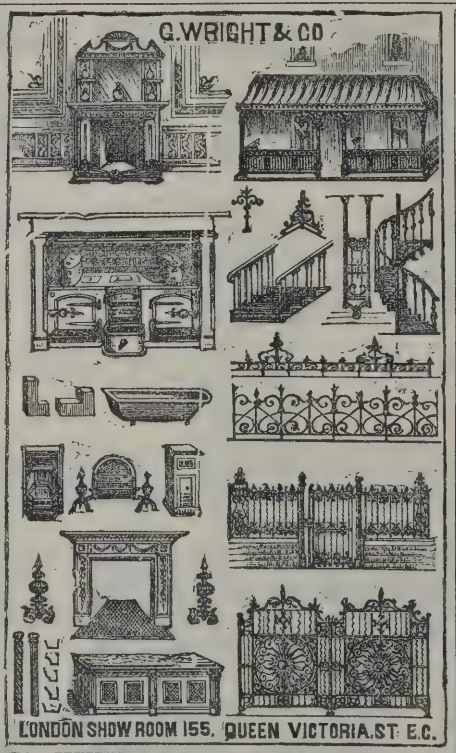
Reversible Four Ways.

JAMES HILL, 100A QUEEN VICTORIA STREET, LONDON, E.C.

interfere very much with the work of building a concrete wall, as well as the high cost of labour, would make such a wall very expensive, so it was decided to try the use of asphaltum for a mortar to hold the boulders together, as a wall made of boulders alone had been easily knocked down by the waves. At various points near this part of the road there are beds of material known as bituminous rock and asphaltum. The first contains fixed bitumen, 24·4 per cent., and ash 75·6 per cent.; the ash, consisting of silica, 46·8 per cent.; carbonate of lime, 9·1 per cent.; oxides of iron and alumina, 15·9 per cent.; and other ingredients, 3·8 per cent. This material is much used in California in making pavements, and in coating piles to resist the teredo, which it does effectually. In order to liquefy it when heated, coal-tar or crude oil must be added. About 200 feet of wall was built with this material, and it has stood perfectly for the last three years, and prevented any washing away of the bank. After building this section of wall, the other material, known as asphaltum, was tried because it was cheaper. It liquefies without the addition of any flux, and when cooled is not quite so hard but more elastic, and on the whole as good a cement as the other. It is often used for lining cisterns, and was used for 800 feet of this wall. The wall was made 6 feet wide at the bottom (where it was in contact with the bed-rock), 2 feet wide on top, and 9 feet high, the landward side, which was built close up against the cliff, being vertical. To economise asphaltum only one-half the wall, viz. 2 feet backward from the seaward face, was cemented. The cost was 3·75 dols., or 15*s.* 7½*d.*, per cubic yard, which included everything except the old ties for fuel, and rail-transportation 28 miles for the asphaltum. In building this wall a layer of stones was placed and the melted asphaltum poured over it so as thoroughly to fill all interstices and run down to adhere to the next layer of asphaltum. In warm weather the asphaltum becomes quite soft, but not liquid, and in this condition has little tensile strength, but the first spray from the waves hardens it just when necessary. The only part of the wall which failed was a short section where, to improve the alignment, it was built a little outside the base of the bank, the space between being filled with sand. During a heavy storm waves dashed over the top of the wall and saturated the sand, and the resulting increase in thrust from behind pushed the wall over. This, of course, could have been avoided by making the wall so high that spray could not fly over it, or by increasing the width of the base to resist pressure from the land side.



COLLAPSE OF BARMOUTH CHURCH.



LAST year, during the Queen's visit to North Wales, Princess Henry of Battenberg, at the invitation of the Dowager-Marchioness of Londonderry, visited Barmouth, and laid the foundation-stone of a new church, designed principally for the accommodation of summer visitors. The site chosen was an excavation in the huge limestone cliff overlooking the estuary, and a lofty tower formed part of the design. After a considerable part of the design had been erected, it was found that some serious defect rendered the foundation unsafe. Great expense was then incurred in trying to strengthen the foundation by means of concrete buttresses, and the building was proceeded with. The roof had been got ready for the slates, and the tower had been built almost to its full height. Suddenly in the early morning of Saturday the tower collapsed and fell into the nave, utterly destroying the building. So far as has been ascertained no lives were lost, but the ruins are being searched. On Wednesday a meeting of the building committee was held to consider the best course of procedure with reference to the disaster to the new tower. It was estimated that the total loss will be upwards of 5,000*l.* Messrs. Douglas & Fordham, architects, of Chester, attribute the catastrophe entirely to blasting operations with dynamite among the rocks immediately at the back of the church. Those operations were undertaken in order to obtain more light for the church. The explosions had first shaken and eventually brought down the tower. The reconstruction of the tower and building will begin immediately.

THE PARK PLACE DISASTER AT NEW YORK.

THE flood of indiscriminate newspaper talk which has followed the frightful disaster in Park Place, New York City, is, writes the *Engineering Record*, about what was to be expected. Sensational clamour seems to be one of the essential requisites of average daily newspaper journalism, and in it the main facts, in any particular case, are generally completely hidden. Nothing, however, would seem to have been more uncalled for than the wholesale abuse which has been showered upon the New York Bureau of Buildings. With the appropriations available for the supervision of building construction and use the department has secured and maintained a reasonable degree of efficiency,

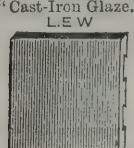
and under the circumstances it is a little too much to expect it to shoulder the consequences of reckless mismanagement on the part of owners and tenants, of a multitude of buildings which originally had satisfied all the requirements for which they were designed.

With regard to the collapsed building, the testimony before the coroner's jury shows that the building was designed and erected twenty years ago under the direction of a competent architect, the upper floors being intended for offices and light business. A load of 200 pounds per square foot was provided for. In the changing character of tenancy, lithographing and printing establishments finally occupied the upper floor, and instead of subjecting the floors to a dead load of only 200 lbs. per foot, it appears that they were overtaxed to the extent of 700 lbs. per foot, after being weakened by years of vibration. It consequently needed only the fall of a case of paper, or some lithographic stones, to bring about the catastrophe which occurred.

The lesson to be learned from all this is that New York City imperatively needs a special Act making it mandatory on the part of the Fire Department to maintain a special bureau for the periodical inspection of all buildings occupied for business and manufacturing purposes. A special appropriation for the work of this bureau should be provided. There is a constant change of the character of tenants in the buildings in different districts of the city, and to expect the present Bureau of Buildings to keep track of such cases with its present force, where, from the wording of the law and extent of the appropriation, it is contemplated only to look after new buildings, alteration to old ones, and cases of special complaint, is unreasonable. It is to be hoped that the next legislature will authorise this needed protection to the working people of New York.

VANDALISM IN GLASGOW.

AT last week's meeting of the Town Council, Mr. Osborne said :—I am sorry to be informed by Mr. Macleod, one of our officers, that some member of the public who has been admitted into the corridors has used some implement, a knife or something stronger, and has defaced one of the principal alabaster pillars. It would be a very great pity if any member of the public should so conduct himself that the Town Council should find it necessary to exclude the citizens from wending through the stairs and corridors, but if such a thing occurs again it will be forced upon us to exclude them. I wish this statement to go forth to the public. We have resolved that these lobbies and stairs, except the marble stairs, shall be as free to the public as the pavements on the streets ; but this can only be continued by the public conducting themselves properly. This depredation has been committed since we assembled here to-day. The damage has been caused on the upper floor. We fear that it has been caused by some parties who have been going either to Mr. Henry's office or to the cleansing department, and who have wandered along and done the mischief. The alabaster pillar to which Mr. Osborne referred has been slashed near the bottom as with a strong knife or chisel.



EMPLOYERS' LIABILITY UNDER FRENCH LAW.

AN examination of the legal relations of the working classes in France with their employers presents us, says the *Scotsman*, with what at first sight appears to be a very striking anomaly. Contrary to what might be expected in a great democratic Republic, in which over one-fifth of the entire population is dependent upon non-agricultural labour, the Code scarcely contains any provisions relating specially to the mutual relations of workmen and masters. This apparent hiatus in the Code is undoubtedly due to the fact that, notwithstanding the numerous regulations with which the acts of all French citizens in general are controlled, the Legislature has always been anxious to avoid any class legislation, fearing, as M. Paul Leroy Beaulieu expresses it, that "by any interference with the terms of contract respecting labour, the freedom of labour itself should be interfered with." The subject, indeed, if touched upon at all, is only alluded to in a very general manner. Thus, Art. 1,710 defines the hiring of labour (*louage d'ouvrage*) as a "contract by which one of the parties undertakes to do something for the other in consideration of a payment agreed upon between them."

The relations of master and workmen are thus legally defined as a contract, and failing further special legislation on the subject, both parties are of course compelled to fall back upon the general law relating to contracts, and are bound to seek within its provisions the rules which must govern their special relations. Free citizens of the Republic, they are supposed to meet and make their own arrangements upon a footing of equality, the obligation to carry out the terms of their contract being regulated by the ordinary law of the land. It is

not considered necessary that this contract should be in writing or even be expressed in words; it is created by the simple fact of the engagement being accepted by the two parties when the conditions appertaining to the contract, whether tacit or expressed, "have the binding force of law upon those who have accepted them." Art. 1,134 of the Civil Code declares that the terms of contracts "must be executed in good faith," and Art. 1,135 requires the observance "not only of the conditions actually expressed, but of those which equity, custom or the law regard as the natural consequence of the contract." Art. 1,159 requires that doubtful or ambiguous conditions should be interpreted in accordance with the local custom of the district, and Art. 1,142 that "every obligation to perform or not to perform any legitimate act entails an action for damages against the party who has failed in his engagement."

The Code, again, is silent as to the special responsibility incurred by the master, as distinguished from that of other citizens of the Republic, in case of accident to the workman, and the latter has therefore to appeal to the general law for compensation for any injury he may have sustained. For years past, session after session, bills have been presented to the French Chamber or to the Senate with a view to establishing special legislation to regulate the employer's liability; but all such efforts have been in vain, as the general opinion of the nation hitherto has undoubtedly been that the interests of the workmen are sufficiently safeguarded by the general laws, applicable to all citizens alike.

Art. 1,383 of the Civil Code declares that every one is responsible for the damage he has caused to others, "not only by an act, but also which may have happened through his negligence, imprudence, or ignorance of what he ought to have known." And Art. 1,384 renders "any persons in authority—parents, teachers, masters and foremen—liable for any damage done by those supposed to be under their control."

From this it follows that the employer's responsibility in case of accident to the workmen is regarded by French law as being controlled first by his position as one of the parties to the labour contract as governed by the articles cited above, and, secondly, by the law which declares the responsibility of all for their own acts and of those in authority for the acts of others whom it is their function to direct and control.

Responsibility, however, is dependent upon power to control, and hence all employers of labour are not regarded as responsible for accidents to the workman, the co-partner in the abour contract, even when such accident is the direct result of the work which the latter has undertaken. This is thus expressed by M. D. Boulanger ("Louage d'Ouvrage," 1891):—"If I contract with a mason to build a wall, or with a slater to mend my roof, each of these men exercises his trade in his way, providing the tools and the materials necessary, and I have no right to direct the way in which the work is to be done. If, therefore, the mason falls from the wall, or the slater's rope breaks, the law can in no way hold me responsible for the result, since I had nothing whatever to do with the matter." But when the employer is a master (patron) the case is very different, for it was one of the terms of his contract that he should control and direct the work, and if the accident be due to his defective direction or insufficient surveillance, his liability is complete. It is so regarded also should it be due to the act of an incompetent or careless foreman, or of men whom he had engaged, just as it would have been had he supplied the injured man with a rotten rope or a broken ladder.

In tracing the general application of the French law as regards this subject, we must suppose the accident to have been due to the fault, negligence or ignorance of, first, the master; second, his foreman, or one of the men he had engaged; or, third, the victim himself. It may also have been due to absolutely unavoidable circumstances (*force majeure*); or, again, the causes may remain unknown. In the first of these cases there is, of course, no doubt as to the liability of the employer. Thus it has been decided that the master is liable for accidents resulting from the explosion of a steam-engine due to a defect in the machine (Lyons, June 3, 1869), or the fall of a scaffolding constructed with faulty materials (Paris, 1890). The application of the law, however, leads at times to somewhat unexpected results. Thus in a boiler explosion a wall and part of the roof were blown down and a workman was killed. The widow, who prosecuted the employer for damages, lost her case in the first instance and also on the first appeal, as it was proved that no fault was attributable to the master. The case was finally decided before the Court of Cassation (April 19, 1887) when it was proved that the engine, being incorporated in the building, was an integral part thereof in conformity with Arts. 524–25 of the Civil Code, and the proprietor of the building was consequently held responsible for the *vice de construction* which had caused the unfortunate man's death.

When the accident is due to the fault of the foreman or of a fellow workman, the victim or his representatives must take action primarily against the actual author of the accident, in virtue of Arts. 1,382 and 1,383, which render every man respon-

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of KALLKOLITH goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where KALLKOLITH is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with KALLKOLITH, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special Terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

sible for his own acts, and also against the master, who by Art. 1,384 is responsible for damage done by persons or things under his control. Should a fatal accident be followed by a prosecution for culpable homicide against the man by whose fault it was caused, and he be acquitted, the master may, nevertheless, be held civilly responsible in damages to the victim's family. (Cassation, May 16, 1887.) The master or overseer may even be held criminally responsible for the fault of others when the accident resulting from that fault was due to the instructions given by them. Thus it was decided on March 6, 1879, that both a contractor and his foreman were criminally responsible for the injury sustained by some of their workmen through a culpably imprudent act performed by others who were working under their supervision. It is, however, only in very exceptional cases that this criminal responsibility attaches to the master.

When the accident is proved to have been due to the imprudence or fault of the victim, the employer, of course, escapes all responsibility. Thus it was decided on February 6, 1889, that the master owed no compensation to the family of a workman who had been killed through his disregard of a danger of which he had been warned. To render the master liable, it is also necessary to prove that the accident happened to the man when actually performing the service for which he was engaged. A carter, who was instructed to convey some casks of wine to a customer of his master's, exceeded his instructions by assisting to place the casks in a cellar. Having been injured in so doing, it was decided at Lyons, December 10, 1869, that he had no claim for compensation, since this part of his work had been undertaken at his own risk. Nor, again, can the workman claim any compensation when the injuries he has sustained were the result of the inherent perils of a trade which he knew to be dangerous, and when no special fault increasing those dangers has been proved against the master. In cases where it is shown that the accident was due to wholly unavoidable circumstances, or where, again, the cause cannot be discovered, the employer is relieved of all responsibility.

The burden of proof of the master's liability to pay compensation always rests upon the injured workman or his representatives. In the opinion of those favourable to a change in the law, this burden of proof should be transferred to the master, who, they consider, should in all cases be regarded as responsible until he has proved the contrary. Thus the loss resulting to the workman from a fortuitous accident, or where the causes cannot be discovered, would generally fall upon the employer, instead of the workman himself, as under the existing law. Such a change, however, the French Legislature has hitherto regarded as supportable only on humanitarian grounds, the workman being the poorer man of the two, but wholly opposed to Art. 9 of the "Rights of Man," which declared that "every man must be presumed innocent" until his wrong-doing has been proved.

STRATFORD-ON-AVON CHURCH.

THE vicar of Stratford (Rev. G. Arbuthnot), having expressed a desire to construct in Holy Trinity Church a "people's altar," the structure to occupy a prominent position between the nave and the entrance to the chancel, a good deal of opposition has been shown to the proposal by the parishioners generally, who contend that a second altar in the church is unnecessary, and that the proposed erection would seriously mar the noble proportions of the church, and block the view of the fine chancel containing Shakespeare's monument. To ascertain the views of the parishioners, the churchwardens caused two memorials to be placed for signature in the Town Hall, one in favour of a "people's altar," and the other against it. At five o'clock on Saturday, when the lists closed, it was found that 250 persons, representing some of the leading parishioners, had signed against the project, while only one name had been recorded in its favour.

POOR STONE IS DEAR STONE.

A PROMINENT and practical stone-cutter writes to us, says the editor of the American journal *Stone*, in the following strain. Practical stone men will recognise its truth, and architects and contractors cannot too soon recognise the points taken, the truth of which many of them will testify by sad experience. He says:—

The stone industry is being menaced with many influences that are detrimental to it, in which are the cutting of prices, ruinous competition; but the principal cause, an inferior quality of rock, while it is really a primary cause of loss, is not generally recognised as such. The rock being used in the buildings in towns and cities at the present time is very inferior compared to that used a few years ago. In using this rock our contractors are encouraging the growth of an illegitimate dickering in quarry land speculation, with no advantage to themselves, but

rather a present loss, with a still greater loss in the future. There are many unknown quantities that are deceptive in the cut-stone business. It cannot be taught as readily as many other kinds of business, unless the contractor observes closely and carefully, and estimates each item of expense in the varied processes through which the stone must go before it reaches its place in the building. Without it he will not know to what cause the shrinkage of his profits is due. Most stone bosses will let a good stone-cutter go, and keep one who will do a dollar's-worth less work in a day simply because he will work for 25 cents less in wages. This evidently would mean a loss of 75 cents per day caused by lack of knowledge; but in no part of the work is this so noticeable as in the use of a poor quality of stone for good work. The difference in this cost of working good and bad rock is so great that in good, clean or moulded work a man could pay the market price for first-class rock and compete, on more than equal terms, with a man who had poor rock given him free of charge. If any employer will take the trouble to test this by timing a practical stone-cutter on a few pieces of work of good and poor quality of rock, and then estimate the cost of each, including the cost of stone and labour, he will find the poor quality of stone will be discounted. Every practical stone-cutter knows this. A good cutter has a regular system of working. He works large drave bats, and in regular succession, and by this means there is not a particle of labour lost. But when this cutter is put on stone that is full of flint or other hard substances it throws him out of his system of working. The corner of the drave dips in at times, and makes it necessary for the cutter to go over a considerable space the second time. Besides these things, he breaks teeth out of the tooth draves, and a continual succession of accidents and irregularities occur. The same is true in rock that is not uniform in hardness. Then again the poor quality of stone is full of defects, such as seams, pockets or large nodules, which often result in the stone being condemned, or it must be patched with shellac, and this is total loss; the latter takes time, and hence increases the expense of cutting, which alone in good work, out of rough stock, will average more than twice the original cost of the stone. The cutter will cut from a fourth to a half more in good rock than in poor. But this is not all. The saw will cut from a fourth to double as much more in good clean rock than in poor rock, and do it much better, as when the blade of a saw strikes a patch of flint or any hard substance it is thrown out of its regular course, and the result is a crooked surface. Here again is extra expense. The rubbing is also expensive for the same reason. There is still another matter of much importance in this connection. I refer to the fact that the work when done is not, when made of this second or third grade rock, as good, either in appearance or durability, and no contractor can long use a poor quality of rock in good work without ruining his reputation both with architects and the public. Besides, it will make that particular stone product unpopular. The fact that permanency in business is a valuable consideration must also be counted in this connection. Any employer who will investigate for himself will find that it will not pay to purchase poor rock at any price.

THE RIBBLE NAVIGATION WORKS.

THE Parliamentary Committee of the Preston Corporation and the Ribble Committee have both decided unanimously, after careful consideration of the report of the Ribble Navigation Commission, recently published, that it is not advisable to apply to Parliament at present for further powers; and that it would be better to watch the result of the north training wall and the extent of trade development during the ensuing year. It is stated that there is sufficient money in hand to complete the dredging down to a depth of 5 feet below the level of 1883, to erect the north wall, and to complete the dock contract and its equipment, thus completing the works as far as Lytham.

THE MANCHESTER SHIP CANAL.

WITH the completion of a second section of the Ship Canal the shareholders of the company may look forward, says the *Manchester Guardian*, with some confidence to the days of profit-earning. Before the end of the present month the salt boats of the Weaver Navigation will depend no longer on Mersey tides, but will sail securely into the canal at Weston Point, and pass through the gates at Eastham into the deep navigable channel of the river, and so to their port of destination. On this traffic, or on a considerable portion of it, tolls will be levied, which will pass into the exchequer of the company. Since the Eastham section was opened two or three months ago the attention of the engineers has in a large measure been centred on the adjoining Ince section. This length covers a distance of 7 miles, and, owing to the soft, marshy character of much of the soil through which it passes,

it has been necessary to pay close attention to the pitching of the banks. The work was declared finished on Saturday, and to all outward appearance it is a most solid and satisfactory performance. On Monday the letting in of the waters began, a depth of over two feet being registered towards the close of the afternoon. There was none of the excitement which attended the completion of the Eastham section. On that occasion the engineers just failed in accomplishing one of the very big feats to which they have accustomed us in the making of the Ship Canal. They sought to close a large gap in the estuary wall during the retreat of a single tide, and being for the moment beaten the country rang with the news. Of course the position was very soon retrieved, but before the *Rocket* made the first passage over the length of the section an embarrassing publicity was given to the operations which were being carried on. There was no anxiety on any such score on Monday morning. In the presence simply of a few workmen, Mr. Jones, the agent of the section, lifted a sluice (much after the fashion of turning a tap), and then through a huge pipe the water poured from the full Eastham section into the empty Ince section. The proceeding was of the simplest character. Between the two sections there is a neck of land 8 or 10 yards in width. Piercing the soil is a pipe 90 feet long and 4 feet in diameter, one end of it being in the Eastham waters and the other emerging some 10 to 12 feet above the bed of the Ince portion. By means of the sluice the quantity of water entering from the Eastham side of the dam can be nicely regulated. Mr. Jones lifted the sluice just so high as to admit half the flow of water which the pipe would carry. Out at the Ince end it hurried in a fine stream into a wooden trough, which carried it without much violence into the bed of the canal. In three and a half hours a depth of 18 inches was measured, and at four o'clock in the afternoon the depth was 2 feet. For some days to come the water will flow in at very much this rate until the requisite 26 feet is reached. By that time of course the Ince end of the pipe will be under water to the extent of some feet. To complete the explanation with regard to the letting in of the water, it is necessary to state that the filling is not to be altogether accomplished by means of the pipe. The Ince section is not less than seven miles in length, and, in order to facilitate the flooding process two temporary dams, each 8 feet in height, were so placed as to cut the bed into three fairly equal parts. One of the dams is at Ince and the other at Holpool Gutter. Until the water reaches the 8-feet level only the first of the three parts is served by the pipe. In the second portion, by discontinuing the use of the pumps and giving play to the natural drainage, a depth of 6 feet was reached on Tuesday morning. In the third portion, from Holpool Gutter to the dam at the mouth of the Weaver, there is now in the same way 8 feet of water. When in the three parts the water reaches a uniform level of 8 feet, and the dams are covered, the canal will rise equally till the water in the two sections forms a perfect plane.

Further operations will be entered upon at the end of the present week, and these, it is expected, will be completed before the 29th inst. The object in view is to connect the Weaver Canal with the Ship Canal. The point of connection is at Weston Marsh, and the method of it is the fine system of locks which have here been built. Between the locks and the canal there is the channel of the Weaver, which the dredgers are making deep—a work which is practically finished. Between the channel, again, and the canal there is a dam or neck of land some 8 or 10 yards wide. When the water in the canal is at the full depth of 26 feet, the dredgers now in the Weaver channel will cut the dam away. This done, they will pass down the canal to Ellesmere Port and assist in clearing the neck of land which divides the Ince and Eastham sections. There will be then a clear stretch of water from the gates at Eastham straight to the locks at Weston Marsh, and 11 miles, or about one-third of the length of the canal, will be open for traffic. The most difficult part of the whole task of the canal engineers will then have been accomplished. The point marked "A" on the Parliamentary plans will have been reached, and the company will be at liberty to make all possible progress—a thing they are yet expressly debarred from—on the adjoining Runcorn section. On the virtual accomplishment of this important portion of the undertaking the engineers of the company deserve warm congratulation. Apart from the great engineering features of the canal, such as the locks at Eastham and the sluices at the mouth of the Weaver—a remarkable monument in masonry—they have had to meet and overcome many grave difficulties. A very considerable portion of the canal is built on land snatched from the sea. In the absence of the tides a deep foundation of piling has had to be laid on which to construct sea walls. The inland portions also have in places given the engineers no small amount of anxiety. It may be interesting to indicate the character of the troubles which faced the workers on the Ince section. From Ellesmere Port to the river Gowy (which passes in a syphon deep under the canal to discharge itself into the

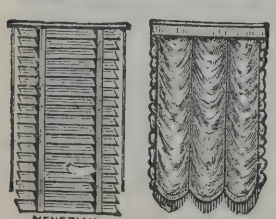
Mersey), there was a tolerably easy cutting through hard clay. From this point to Ince, however, the soil consists of soft marsh clay and peat, and it was necessary continuously to guard against the occurrence of slips. For a long distance after this point a clean cutting had to be made through the hard red rock, and as the surface was hilly there is a straight wall at one point not less than 70 feet high. After the rock there was more marsh clay to contend with, and finally a long stretch of shifting sand. As a consequence of having to deal with soil of this sort, the slopes of the Ince section have had to be made very flat, being in the worst places only 1 foot vertical to 4 feet horizontal. In its completed state nothing could look more substantial than this section. There has been no niggardliness in the use of masonry and in some places of brick. As an extra strengthening fascine work, such as we see in the canals of the Low Countries, has been introduced. The strong cording of willows in the banks is quite a feature of this portion of the work, and in summers to come their greenness will pleasantly break the monotony of stone walls.

The 29th inst. is provisionally fixed for the passage of the first boats from the Weaver Navigation to the Ship Canal.

IMPERIAL VILLA, CORFU.

THE correspondent of the *Daily News* in Vienna says that the Empress of Austria's villa on the island of Corfu is now completed, and the artists and artisans who return from having helped to finish it are full of praises of the fine house and the lovely spot upon which it has been built. The property extends over twenty-three acres, which were planted with olives and cypress trees immediately after the place was purchased, and long before the Empress began to build her house. The property is situated in an olive-crowned valley called Casturi, twenty minutes' drive from Corfu, and the villa rises on a hill commanding a splendid view of the sea. The house is a three-storeyed palace in the purely Greek style, with a fine Pompeian portico, which is entirely built out of pink marble. There are thirty rooms, adorned with frescoes by Italian artists, the subjects being almost all taken from mythology. The wood used is old walnut, and the tapestries and carpets are fine specimens collected by the Empress during her voyages in the Mediterranean ports. There are numerous bronze and marble statues both in the house and around it, on the terrace and in the gardens.

YOKOHAMA HARBOUR WORKS.



THE accompanying advertisement respecting the supply of material for a new pier at Yokohama has been received at the Foreign Office. The specifications, &c., mentioned in the advertisement may be seen at the Commercial Department of the Foreign Office between the hours of 11 and 5 :—"Yokohama Harbour Works.—Tenders will be received at this office between 9 A.M. and 11 A.M. on December 4 next for the supply of some 3,600 tons of iron screw piles and shoes, with other materials and accessories, for an iron pier for the Yokohama Harbour Works. Persons desiring to tender may obtain copies of the specification and forms of tender and agreement on application at the Kanagawa Kencho. The specification also gives the particulars to be observed in tendering. The security-money which has to be deposited with each tender, at the time of tendering, is 11,310 yen. The tenders will be opened at the Kencho at 11.30 A.M. on December 4 next. The contract on the part of the Kanagawa Kencho will be entered into by Mr. Nobukata Mitsuhashi, counsellor of the Ken, and chief commissioner of the Yokohama Harbour Works. Kanagawa Kencho, Yokohama, August 4, 1891."

THE ST. CLAIR TUNNEL.

THE chairman of the Grand Trunk Railway, Sir Henry Tyler, who has been making a tour of inspection over the company's many lines, is about to complete his official duties in Canada by formally opening the St. Clair Tunnel. This tunnel forms a land connection between the Canadian lines and the American lines under the same management running to Chicago. Hitherto the trains have been carried over the St. Clair river—the outlet of Lake Huron—on huge ferry-boats, which were liable to be delayed by ice in winter, as well as to the ever-present risk of crossing a rapid stream. The tunnel not only abolishes these risks, but makes the time of transit very much shorter, and a simultaneous alteration in the routes of approach to the river has reduced the length of the line by six miles. The tunnel is 6,026 feet long, or 11,553 feet including its excavated approaches. The boring of the tunnel proper was done by means of large and heavy wrought-iron shields with sharp cutting edges, each shield being driven forward by hydraulic rams of enormous power. From the time when the shields were lowered into

position at the two proposed entrances till they met in the middle the work occupied just a year. The tunnel is 20 feet in diameter, and is lined throughout with cast-iron plates 2 inches in thickness. Over 880 tons of bolts and nuts were used in constructing the lining, which weighs altogether 28,000 tons. The road bed under the river is practically level, but the gradient of the approaches is 1 in 50. Arrangements have been made for electric lighting all through the tunnel and for thorough ventilation. The cost of the tunnel proper is given as 292,000*l.* Four large locomotives have been provided for use at and in the tunnel, weighing 42½ tons apiece.

REGISTRATION OF PLUMBERS.

THE second examination of plumbers in connection with the above movement was held in Southampton on Saturday, Sept. 12, when fourteen candidates presented themselves. The written examination was held at the Hartley Institution, and the practical part of the test was conducted in Mr. Brazier's workshops in Canal Walk. Nine of the candidates succeeded in satisfying the examiners, the remaining five failed. Those successful were Messrs. G. Seal, C. Lovejoy, J. Cosser, G. Ridyard, J. Biles and G. Hinwood, all of Southampton; A. Marshall, Bournemouth; W. Brazier and J. Lilley, Christchurch.

ARTESIAN WELLS FOR DESERT RECLAMATION.

THE most remarkable example of reclamation by means of artesian well water, says United States Irrigation Commissioner Hinton, in an official report, is found in the desert provinces or departments of Algeria under the French rule. The area, officially given, of French Algeria, is 184,465 square miles. The outlying portion is put at 135,000 square miles. In this total of over 329,415 square miles one-half belongs to the Sahara, or desert. The European population in 1887 was about 250,000; the natives and naturalised were 3,328,549, making a total of 3,578,549. Cultivation by means of flowing well waters has been sedulously fostered by the French colonial government for both political and economic reasons. Such wells as a means of reclamation began systematically to be bored in 1857, the French engineer, M. Jus, having demonstrated in 1856 that the desert was endowed with large supplies of underground water. The total number of wells that have been bored since that date in the departments of Algiers, Oran and Constantine, is stated at 13,135. These wells range from 75 to 400 feet in depth, and the low pressure common to the majority of them forces the water to a distance of about 2 feet above the ground. The waters are then collected in small ditches, which convey them to the vineyards, date-trees and fields of durra, millet, wheat, &c., which comprise the chief products. In all, about 12,000,000 acres have been reclaimed in this way. The Government bores are at least one-tenth of the whole number.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

14665. Albert Brigg, for "An improved method of excluding the draught through windows."

14731. Thomas Bentley, for "Improvements in radiators for warming and heating buildings."

14747. John Britten, for "Improvements in self-feeding boilers for domestic and other similar purposes."

14750. John Henry Lord, for "Improvements in racks for window blinds."

14751. Thomas Jenner, for "Improvements in hinges."

14781. Joseph Jasper Crane, for "An improved metal fence post."

14820. Charles James Henderson, for "Warming, ventilating and lighting apparatus."

14845. Gustave Jetley, for "Jetley's patent festoon blind action."

14867. Bartholomew Binnington, for "Improvements for the better roofing of buildings."

14966. John Harrop Jones, for "Improvements in or applicable to sash fasteners."

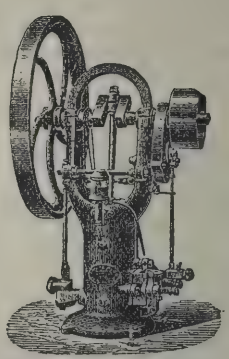
THE

"GRIFFIN" GAS ENGINE.



In the Competition for Gas Engines held by the Society of Arts,

GOLD MEDAL

Awarded to the "GRIFFIN" Gas Engine.

Horizontal Type.

Single-acting Vertical Engine,
From ½ to 4-Horse Power.

CHEAPEST, SIMPLEST, AND MOST ECONOMICAL GAS MOTOR.

SUITABLE AND USED FOR

Hoisting, Sawing, Printing, Pumping, Grinding, Mining, Chaff Cutting, Polishing, Organ Blowing, Sewing Machines, Dairy Work, Boot Making, Pulverising, Soda Water Machinery, &c., &c., &c.,

AND UNEQUALLED FOR ELECTRIC LIGHTING.

Professor JAMIESON, M.I.C.E., F.R.S., Glasgow, in his Scientific Report, says:—

"Throughout the whole of my electrical test the *Engine* WORKED VERY STEADILY; *in fact I have never before tested a Gas Engine which maintained such uniformity of speed* at full power; *no pulsation or blinking being observable in the incandescent lamps.*"

And Professor KENNEDY, F.R.S., M.I.C.E., University College, London:—

"There is no doubt that it is a most important practical advantage of the 'Griffin' type of Engine, that it can be made to accommodate itself to variations of resistance not only without alteration of mean speed, but also without alteration in the number of explosions per minute, and therefore, without any alteration of steadiness."

BRITANNIA TIN AND COPPER WORKS.

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4s. 6d. and 6s. each. Household and Fancy Filters, from 10s. Water-Testing Apparatus for detecting Impurities in Water, 10s. 6d. and 21s. each.

Portable Cistern Filters.

TRADE NOTES.

EXTENSIVE factories have been erected at Leicester, and the most careful attention has been paid to the ventilation, which has been carried out by the "Climax" Ventilating Company, of 15 Great George Street, Westminster, S.W.

A LARGE clock was formally started in the parish church of Kendal on the 11th instant. It is fitted with all the latest modern improvements. The quarters are chimed on four bells, the same as at Westminster, and the hours are struck upon a 25-cwt. bell. The escapement is a double three-legged gravity one, and the pendulum is compensated for changes in the weather, all the wheels have machine-cut teeth, so as to be perfectly accurate, and the whole of the parts are arranged so that any part may be removed without interfering with the others. The work has been carried out by Messrs. John Smith & Sons, Midland Clock Works, Derby.

ART PLATES FROM "THE ARCHITECT."

AWARDED GOLD MEDALS,

International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOF IMPRESSIONS

OF

JOHN SELL COTMAN'S PICTURES,

LATELY ON EXHIBITION AT THE

BURLINGTON FINE ARTS CLUB.

The Plates are uniform in size, 21 inches by 15 inches.

No. 1. The Storm at Sea.

No. 15. Cader Idris.
„ 16. Castle Eden Dean, Durham.
„ 17. Bamborough Castle.
„ 18. The Interior of Norwich Cathedral.
„ 19. Mountain Pass in the Tyrol.
„ 20. Postwick Grove.

The price of the above Set is 17s. 6d.; by post, carefully packed in patent roller, 18s.

KINDLY ORDER EARLY, AS ONLY A LIMITED NUMBER OF PROOF COPIES CAN BE OBTAINED

Through your Newsagent; Messrs. W. H. SMITH & SON'S Bookstalls; or from

P. A. GILBERT WOOD, 175 STRAND, LONDON, W.C.

MESSRS. WOODHOUSE & RAWSON UNITED, LIMITED, have opened a branch office at 89 Bothwell Street, Glasgow, under the management of Mr. B. F. Howard, who has been appointed agent for Scotland. In connection with this branch a sample room has been fitted up, containing specimens of all their own specialties, as well as of the most approved fittings and appliances of other important makers, so as to afford facility in selection to intending buyers. Any novelties or improved apparatus which may from time to time come on the market will at once be added to the sample room, thus keeping it thoroughly up to date.

A CARVED oak screen has been placed in St. Thomas's Church, Stourbridge, as a memorial by a member of the church. It was designed by Mr. W. H. Bidlake, M.A., Birmingham, and is Classic in detail. It forms a partition which divides the vestry from the chancel. The bottom framing is filled in with cathedral glass to admit light; above this is a richly-moulded string-course, carrying the screen up to the floor of the gallery, and from this level it is continued by moulded columns with elaborately-carved canopies supporting traceried arches and a very handsome overhanging frieze. The whole is richly moulded and carved, and the structure is surmounted by a carved cross. The work was carried out under the personal superintendence of he architect, by Messrs. Jones & Willis, of Birmingham and London.

THE Kirk Hammerton Schools, York, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Mr. E. H. Shorland, of Manchester.

WE are informed by Mr. Farrar, the London agent for Mr. Wilson Hartnell, Leeds, that he has secured the order for the electric lighting of the new flour mills for Messrs. James Tucker, Limited, Cardiff. When complete these premises will rank amongst the largest in the country.

AMERICAN NOTES.

AS reports have been circulated which raise doubts about the stability of the buildings for the Chicago World's Fair, a memorial has been sent to the Secretary for War asking him to send two military engineers to report upon the character of the foundations and any other parts that have been constructed.

THE assessed value of property in the United States is now double the value that was made out thirty years ago. In 1860 the assessed value was 12,084,560,005 dols., while, according to the last return, it is 24,249,589,804 dols. The richest States at present are New York, Pennsylvania, Massachusetts, Ohio and California. The assessed valuations in these States ran from over 3,775,000,000 dols. to 1,071,000,000 dols. Massachusetts has 962·12 dols. per head of assessed values; Rhode Island, 931·28 dols.; California, 886·58 dols.; Montana, 805·04 dols.; New Hampshire, 671·19 dols.; and New York, 629·44 dols. South Carolina has only 114·83 dols. per head; Mississippi, 122·15 dols.; and Alabama, 130·26 dols.

THE coroner's jury that investigated the cause of the fall of the building in Park Place, New York, have come to the conclusion that the catastrophe originated in a shock. What the shock was due to they were unable to determine. They recommended that the Legislature be requested to authorise the establishment of a bureau for the periodical inspection of manufacturing premises.

AN Odd Fellows' temple is about to be constructed in Chicago. The ground space is to be built up to a height of fourteen storeys, and above this the building extends six storeys in the form of a square cross, the four spaces at the angles of the main building being left vacant. Above this is to be a tower-shaped structure fourteen storeys high, making thirty-four storeys altogether, with an aggregate height of 556 feet. The estimated cost is 3,500,000 dols. The ground space covered is to be 177 feet by 233 feet.

ONE of the greatest curiosities of the Chicago World's Fair promises to be that sent by Tulare, California. A redwood tree is growing there which is 390 feet high. It is intended to cut from this tree a log 90 feet long and 20 feet in diameter. By cutting the log in half and hollowing out each portion, it will be turned into two railway carriages, one fitted up as a dining-car, with buffet, bath-room, barber's shop and kitchen, the other to be a sleeping car, with an "observation" room. The rough bark of the tree will be left on for the roof, while the sides and ends will be of the natural wood unpolished. The cars will be occupied during the exhibition by the families of the makers, and the rest of the tree will be cut up and worked into souvenirs.

MR. S. P. STICKER, an engineer, of Buffalo, N.Y., claims to have discovered a method of making ice by means of illuminating gas, which may be returned to the mains after use without deterioration. By experiments in the works of the

Provincial Gas Company at International Bridge, Ontario, he produced a temperature of 80 deg. below zero by the use of water and gas only, without chemicals.

VARIETIES.

THE Leith Dock Commissioners have prepared a draft Bill to be presented to Parliament next year for the construction of a new dock. It is proposed to reclaim an area of about 54 acres, in which a deep-water dock, about 1,000 feet long and 375 feet wide, will be constructed. Sir Alexander Rendel has proposed that the lock should be so constructed as to permit vessels going in and out in almost all states of the tide.

THE Steel Company of Scotland, Limited, produced during the year just ended 160,000 tons of steel ingots. In the preceding year the quantity was 260,000 tons. The deficiency is owing to strikes among workmen.

THE city superintendent of Edinburgh has been instructed to prepare a plan for carrying the main staircase of the City Chambers down to the basement, including an entrance from Cockburn Street.

THE Tewkesbury Town Council have agreed to allow the use of the Corn Exchange for science and art classes, and to permit a laboratory being built on land in rear of the Town Hall.

THE Local Government Board have sanctioned application for a loan of 1,300*l.* for building an addition to the Town Hall of Dalkey, near Dublin.

PUBLIC baths are to be erected near the Griffin Inn, on Cheetham Hill Road, Manchester.

DR. CHURCHILL JULIUS, Bishop of Christchurch, New Zealand, with his own hands has laid the top brick of his cathedral spire at a height of 270 feet from the ground, having been hauled up seated in a chair fixed at the end of a rope.

A PUBLIC inquiry has been held at the Town Hall, Halifax, respecting an application by the Corporation to the Local Government Board to borrow 111,560*l.* for various improvements. The amount included 50,000*l.* for new markets from the selected designs of Messrs. Leeming & Leeming, 7,000*l.* for baths at Woodside, 30,560*l.* for new streets and street improvements, 20,000*l.* for sewerage, and 4,000*l.* for walks and pleasure-grounds. There was no opposition to any of the schemes.

MR. RICHARD J. COLLIER, of 34 Finsbury Pavement, E.C., held a very successful sale of building land at Freshwater, in the Isle of Wight, on Thursday, September 17. This is the second portion of the Afton estate, Freshwater, and it will be remembered that Mr. Collier's sale of the first portion was also a great success. The land realised nearly 4,000*l.* Building land in the Isle of Wight seems to be a sound investment, and very popular at the present time.

IT is proposed to hold an exhibition next year in Southport in celebration of the centenary of the town.

VISITORS to Blackpool next summer will find three instead of two piers. The intended new pier, which is shortly to be commenced, will be situated near the tram terminus opposite Station Road, South Shore, and will be the first erection of any kind in that district devoted to purposes of entertainment. There have been during recent years large extensions at South Shore, and the new pier will, it is expected, lead to its further development as a residential district. Already there is a residential population of 30,000 to 40,000 visitors in the district every summer.

THE largest lumber mill in the world is supposed to be one at Port Blakeley, Washington. Last year this mill turned out 69,000,000 feet of lumber, over 28,000,000 laths, and a large amount of other stock.

THE value of the timber and the timber-products exported from Norway during the past year was 2,453,881*l.*

ACCORDING to the *Essex Herald*, the Colchester Museum contains a curious exhibit, presented by a mysterious "John Smith, Esq." It consists of a solid block of Roman mortar from the Town Wall, with a heap of crumbling white dust by the side, described as "Mortar with which the town wall was repaired in the nineteenth century."

THE artesian well at the artisans' dwellings in the Minories has at length reached the contract depth of 352 feet, and yields from 17,000 to 19,000 gallons of water daily. The dwellings contain 1,200 inhabitants, and as it is desirable to provide a minimum supply of 20 gallons per head per day, the Commission of Sewers for the City have agreed that an additional depth of 100 feet in the chalk should be sunk.

MR. THOMAS MOBLEY, of Birmingham, died this week in his eighty-seventh year. Until a few weeks ago he worked regularly at Messrs. Tonks, Limited, by whom he had been employed for no fewer than seventy-three years. He was senior

trustee of the Brassworkers' Association, and was regarded as the "father" of the trade, and the oldest brassworker in the world.

LADY VERNON, of The Towers, Poynton, has intimated that she will present a reredos of Derbyshire alabaster to St. George's Church, Poynton. Designs have been made by Mr. Alfred Darbyshire, F.R.I.B.A. It is also contemplated to spend 300*l.* on the beautifying of the church.

MR. W. H. RADFORD, C.E., of Nottingham, has been instructed by the Corporation of Durban, Natal, to draw out plans and specifications for the supply of six miles of steel tram-rails, with all necessary fittings.

THE John Hampden monument on Chalgrove Field affords an instance of the precautions taken by local authorities to circumvent the ways of tourists. So many names, principally those of Americans, have been carved upon the obelisk that a ditch has been dug round it and a railing erected to keep visitors at a safe distance.

THE consideration of the long-delayed building by-laws for the city of Bombay, remarks the *Bombay Gazette*, has at length drawn nearly to a close, so far as the labours of the Corporation are concerned. To the professional mind there is something of the ridiculous in an assembly of laymen, who know nothing about the dimensions of beams and joints and the scantlings of roof-timbers, and the pressure upon bricks and mortar, whether "good" or otherwise, discussing formulæ and voting as seems best to them sections of whose real bearing and operation they cannot form any clear idea. However, the work has got to be done, and it has been done somehow.

DEAN ARGLES, who has already largely subscribed towards the restoration fund of Peterborough Cathedral, is going to present the new marble pavement, which will cost 2,400*l.*

A FREE library is to be erected in Kidderminster at a cost of 3,213*l.*, exclusive of fittings. Towards the cost subscriptions amounting to 1,433*l.* have been promised.

A LOCAL Government Board inquiry has been held at Huyton, near Liverpool, in respect of the application of the Local Board to borrow 3,000*l.* for the erection of offices, according to plans by Mr. H. A. Cheers, Twickenham.

A FREE University has just been opened at Gotheborg. This institution has been called into existence entirely by the munificence of several generous citizens, and has received no State aid whatever. In 1878 two rich merchants, Messrs. Lundgren and Magnus, gave 600,000 kronen towards the building of a high school, and in 1885 a wealthy brewer added the munificent gift of half a million kronen. In November 1887, when the subscriptions had reached 1,750,000 kronen, the Municipal Council resolved to form a University, for which the services of many learned professors of Upsala and Lund have been secured.

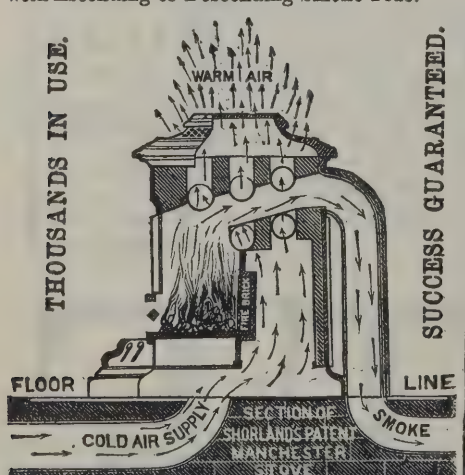
BUILDING AND BUILDERS.

THE foundation of the Kingswood Reformatory has been laid. The contractors for the buildings are Messrs. Love & Wait, of Bristol.

MESSRS. MACDONALD & SON, of Hawick, who some time ago secured the contract at 6,000*l.* for carrying out a sewerage extension scheme for the Corporation of Workington, in Cumberland, according to the *Scotsman*, have had to suspend operations owing to the alleged impracticability of the working drawings supplied by the officials of the Corporation, and they have caused a writ to be served upon the Corporation in an action to recover 7,000*l.* for work done and damages. The case will be tried at the next assizes at Carlisle.

A SALVATION ARMY citadel is about to be erected in Aberdeen from the designs of Mr. Souttar. It will cost at least 15,000*l.*

A NEW Board school is about to be erected by the Rochester School Board in the Strood division of the city.



THE Ramsgate Town Council have resolved to commence the authorised improvement by which West Cliff and East Cliff will be united. Tenders will immediately be sought for the execution of works on the first section between the West Cliff and the Town Quay.

A REMEDY FOR SMOKY LONDON.

IN the *City Press* there is a long communication from Mr. Harry G. Assiler, in which he advocates the removal of factories from London as the first measure which should be adopted in dealing with the London smoke nuisance. He says:—

As a rule a variety of alternative remedies are open to us for the majority of the evils which trouble us in this life, and in all cases it is well to review them in order that we may see which is the best under the circumstances before taking action, and

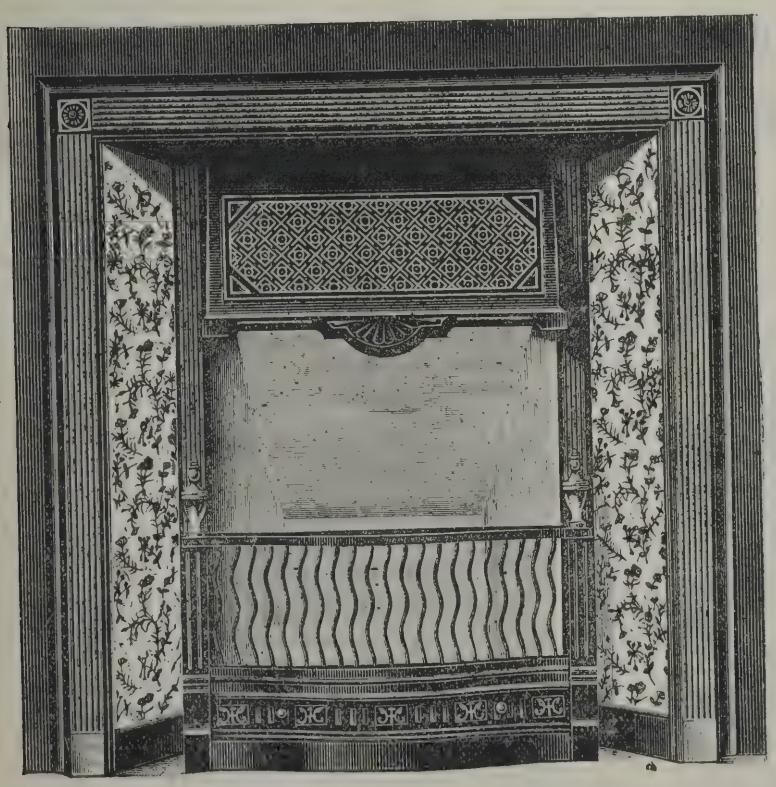
not rush at the first one which presents itself, dismissing at first glance all others as impracticable, without looking minutely into them, and carefully weighing and following out their effects to the fullest extent. Such must be our treatment of the smoke question. We suffer from an evil, and the first thought to rid ourselves from it if it is an unmixed evil is to remove its cause—cut off its source. If the evil is not unmixed with good, we naturally seek some remedy for reducing the evil while retaining the good. This is particularly the case with the present subject—we can hardly do without fires, but we could do very well without their resulting smoke.

With regard to domestic fires, we cannot abandon them; there is no doubt, however, that the evils which arise from this cause could, by careful arrangement, be so reduced as to be of little moment, if not altogether removed. The domestic fireplace is, no doubt, at the present time a very serious offender, but this is because no effort is made to consume the smoke or mitigate the evils arising therefrom; the great and most difficult offenders to deal with are the factories. We may assume that in nearly all cases every effort is made, and the best known appliances used for consuming the smoke of factories, but still the smoke escapes unconsumed—the factory owner, if indicted, shows he has used the best known smoke-consuming apparatus, and his liability ends (16 and 17 Vic. c. 128, s. iii.).

This state of affairs indicates that if London could be ridded of factory chimneys and furnaces, it would be a comparatively easy task to consume that proportion of the smoke contributed by domestic fires, by the introduction of a new system of burning fuel; it is well-known that the present form of fireplace is wasteful and productive of evil, and the system is undoubtedly radically wrong. And on the same principle that a builder or owner of a house is compelled to trap off the drains from the sewer, or build up his party walls above the roof, and do scores of other things to satisfy the provisions of the law, he might be obliged to provide smoke-consuming stoves.



The question presents itself therefore:—Is there any valid reason why all factory chimneys and shafts should not be banished from the metropolis, and not permitted within a certain radius—say ten miles of the Bank of England? The expense in the way of compensation would of course be a considerable item, but it is ventured that the annual value to London of the consequent clear atmosphere would compensate for it. And by judicious treatment the amount of compensation, while being fair, need not be of very serious proportions, although in the total it would be undoubtedly of some considerable magnitude. It will readily be seen that a large proportion of the manufacturers now carrying on business within the suggested prescribed area would, under such conditions, have only to transfer a portion of their business—in many instances a minor portion—outside the radius, their premises still being available for the greater part of their business. And then less space would be required for the business in London, and rents being lower outside, and access easy to all parts, the cost of production would not be prejudicially affected; indeed, it would probably be lowered.

Another good effect resulting from the adoption of such a course would be the removal of a large portion of the working population, who are now compelled by circumstances to live in crowded, unhealthy localities in town in order to be near their work, to much healthier surroundings in open suburban quarters, so the benefit would be twofold. There are hundreds of spots eminently suited for the erection of factories around London, especially on the north and west, with which first-class communication, both by railway and canal, already exists.

Having got rid of the factories, we should have reduced the item to a considerable extent; but we should still have the smoke from domestic fires and other sources as yet uncontrolled, with which we should have to deal. It has been suggested that the open fireplaces should be done away with, and dwellings warmed by a central heating chamber, or that several dwellings even should be warmed in combination. It is to be hoped that we in England will never come to this. Forced as we are by the nature of our climate to spend much of our time indoors, we have become endeared to the open fireplace, and find great comfort in it, and it is, besides, a ready means of affording ventilation—a matter of great moment.

It may be urged that such a measure would be a retrograde step savouring somewhat of the Middle Ages, when the use of smoky coal brought by sea from Sunderland and Newcastle was prohibited in London, and impracticable, as interfering with the "liberty of the subject" upon which we English people pride ourselves; but when there is so much freedom surely it becomes more a matter for consideration that that freedom should not be used to endanger the well-being of the community. A person has the power to protect himself against the existence of deleterious matter in water by boiling, filtering, &c., but how is he to protect himself against the effects of the carelessness and wilfulness of those who poison the atmosphere? And even if the "liberty of the subject" is to an extent interfered with—although it is not admitted that the course suggested

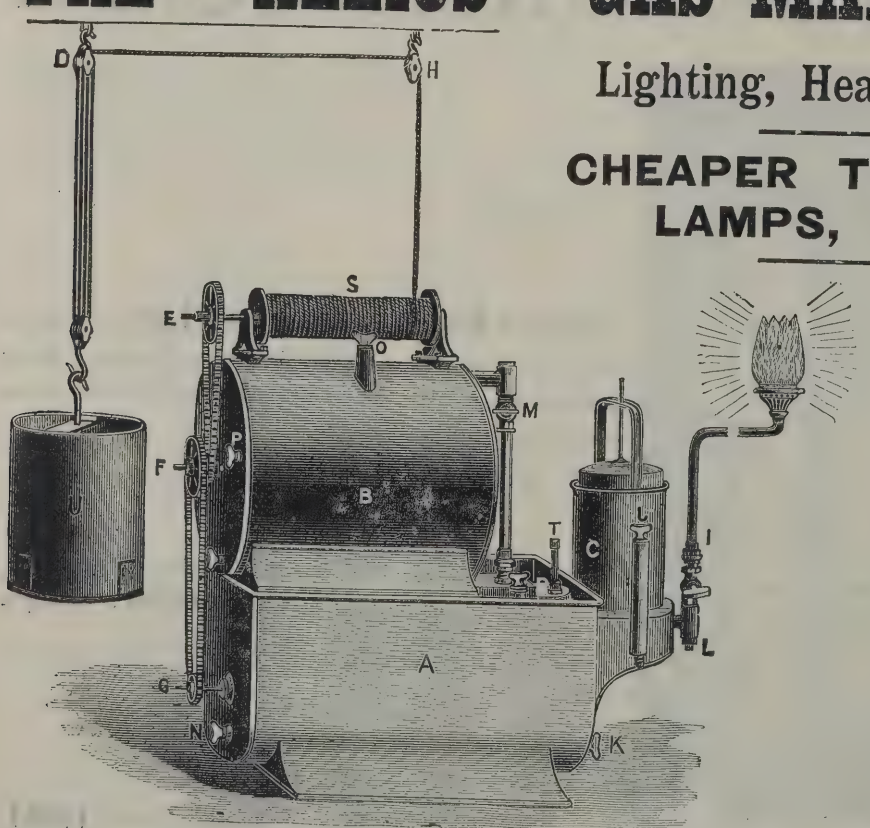
LONDON, E.C.

PATENT No. 2496. A.D. 1884.

would unduly interfere with it—it would be for everybody's benefit; but, apart from this, the whole essence of the matter, and what must in the end be relied upon to alter the present state of things is public opinion. Were it generally shown how highly demoralising the atmosphere of our metropolis is, and some feasible and rational means of ridding the great city of its dreadful pall brought forward, people would not be slow to adopt it. Let it be considered what a tremendous saving would be effected, even in the cost of illumination rendered necessary by the present prevailing smoke-laden fogs, let alone the cost of repairing, redecorating and cleaning buildings, the fabrics of which, as well as other objects and materials, are ruined and destroyed by the present atmosphere of the metropolis. Taking all these things into consideration, one feels justified in expressing the opinion that, although the compensation necessary to remove the factories and alter the existing state of affairs in the City would mean, for a time, an increased charge on the rates, the sum payable in this way would not exceed that which is now paid away through hundreds of other channels on account of the ravages of the fog demon, and which would entirely disappear were the destructive properties of the smoke and gases removed, in addition to which there would be the inestimable luxury derived from having a comparatively pure atmosphere which the denizens of London, even when befogged, might breathe in safety. Let any one acquainted with the matter sit down and carefully think out the expenses which may be traced, directly or indirectly, to the smoke, and try to form an opinion what it costs the citizens of London annually for the luxury of perpetually living in a smoky atmosphere with nice periodical black fogs, and then consider whether it will cost much more to remove the nuisance than to fight it.

MUNICIPAL CONTRACTS IN EDINBURGH.



AT the meeting of the Edinburgh City Council on Tuesday Mr. Lang Todd asked whether any explanation could be furnished as to a complaint of Messrs. William Gray & Son, Frederick Street, who had held the contract for 1890-91 for smith and ironmongery work required by the Corporation, that all the work in these departments had not been given to them. Bailie Russell, convener of the Public Health Committee, replying, said the firm in question had made a complaint of this character in May, when the matter had been remitted to the Public Health Committee, and from them to the Law Committee, and on looking up the committee's minutes he found the word "delay" opposite the entry. He was prepared to make an explanation in regard to the matter, and he thought he could best do so by reading the report from the City Superintendent (Mr. Morham) to the committee, made on May 12, 1891. This report was to the effect that the complaint proceeded on the assumption that the contractor for the smith and ironmongery work was entitled to be employed in providing everything in his line of business that might be required for the Corporation purposes during the currency of the contract. According to the City Superintendent, the contract consisted of an undertaking on the part of the contractor to keep in order the locks, hinges, &c., of the various city properties, &c., and "a schedule of prices for day work, jobbing and repairs, and for materials not included in the foregoing." There was no word of the supply of general ironmongery furnishings or of made-up goods being included in it. On the other hand there was, the City Superintendent stated, an express provision that the magistrates did not bind themselves to take everything from a contractor, and reserved full powers to enter into any special contract where that course was considered desirable. The employment of ex-Bailie Walcot had arisen from the purchase through him of two of the gas-cooking stoves from the exhibition. Being thus on the premises, ex-Bailie Walcot, according to Mr. Morham, had been afterwards employed, with the sanction and express direction of the Public Health Committee, to provide a number of other furnishings and pieces of work more or less in connection therewith. This had been in no way inconsistent with previous practice with regard to such furnishings, &c., both for the City Hospital and Campie House, where Mr. Foulis had been employed to provide a very large number of ordinary furnishings, as well as specially-made articles, though not general contractor for the time. As regarded the repair of the park-fences and tree-guards, distinct instructions, the report said, had been given by the Public Parks Committee to employ firms who were specially in the habit of dealing with such work, rather than the contractor for ordinary smith-work. Bailie Russell added that in case any one should ask why it was that the committee had not bought from the firm of William Gray & Son that which the committee held to be outside the contract, he would just say that in the urgent work of the hospital last winter the committee had to go to people who they were sure would act promptly and successfully. The committee could not, in the urgent circumstances, go to any person for the required work unless they knew that

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

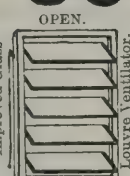
they would put themselves about to serve the committee as Mr. Walcot and Mr. Foulis had done. After a short conversation the matter dropped.

THE BRIGHTON RAILWAY.

THE Act for the incorporation of a company to construct a railway between London and Brighton received the Royal Assent on July 15, 1837. The number of shares was to be 36,000 of 50*l.* each, or 1,800,000*l.* An additional sum of 600,000*l.* was allowed to be borrowed, making in all 2,400,000*l.* But that sum does not represent more than a part of the outlay on a system of which the jubilee is celebrated this week.

The Act was not obtained without one of the toughest fights ever witnessed in Parliamentary committee-rooms. According to Mr. Francis the London and Brighton contest was a proverb for reckless extravagance. Mr. Whishaw, writing when the works were nearly completed on the Brighton section, said:—Parliamentary contests are never carried on without a great sacrifice of money. How much more judicious a plan would it be for parties interested in competing lines of railway to refer the selection of the best plan to competent and disinterested engineers "out of doors," and thus leave the course in the various stages of its progress through Parliament comparatively clear, and uninterrupted by vexatious and unnecessary opposition. There cannot be a more easy task allotted to an engineer, who is thoroughly conversant with railway matters, and has the details of each laid before him, than to select from two or more projected lines of railway that which ought on all accounts to be chosen. Had such a method been adopted with regard to the various lines projected to Brighton, a large sum of money would have been saved for the more useful purpose of constructing the great works which had to be encountered in effecting a railway through the natural barriers between London and Brighton. As it is, the direct line has been chosen; but a more difficult and expensive one could not have been selected. Many of the engineering works are of a formidable character, and are necessarily prosecuted by night as well as by day, in order to open a portion of it as early as possible, according to the intention of the board of directors. As a forced march through a rugged country is attended with considerable fatigue to soldiers encountering it, so a forced passage for a railway through any district, however easy, for the purpose of effecting a premature opening, is alike attended with considerable risk to the traveller, and an unnecessary sacrifice of funds on the part of the proprietary.



The Stockton and Darlington Railway made it plain that a new mode of communication was feasible, and in 1825 a scheme was put forth for the construction of a line from London to Brighton, but the public did not respond, and as the money was not forthcoming there was no practical result. Various attempts were subsequently made to get up a company, but they all failed. In 1835 there was more faith in railways, and several proposals for a line to Brighton were brought forward. It was no easy matter to determine the respective merits of the competing projects. A correspondent of the *Times* says that if "read in the light of present-day experience, much of the evidence that was given before the committees, even by engineers of such eminence as the two Stephensons, Rennie, G. P. Bidder, Vignoles, Mills, Locke and others is amusing, and some of it is almost absurd. The utmost speed claimed for the line with the easiest gradients was thirty miles an hour, and Bidder made much of the point that a train could not run over Rennie's line at a greater speed than twenty-five to twenty-eight miles an hour. Many trains have now for a number of years past been running over practically the same ground at a speed of fifty miles an hour. No one at that time appears to have anticipated that the distance between London and Brighton could be covered in less than two to two and a half hours, whereas now about an hour is the actual running time of the express trains. The great forensic lion of that day in the Parliamentary committee-rooms was Serjeant Mereweather, who tried hard to nonplus the most skilled engineers, and before whom even George Stephenson, excellent witness and wideawake as he generally was, found it difficult to hold his own. A great point made, or attempted to be made, against Stephenson's line through the valley of the Adur, was that it was liable to heavy fogs. "Your weak mind," said the Serjeant, addressing the elder Stephenson, "would be astonished if you heard that the fog there sometimes lasted for a week or ten days. . . . Is that a pleasant thing for a railway to pass through?" "It would be an objection," said Stephenson, "but not sufficient to deter you from taking a railway through a country. I should consider the fogs in the neighbourhood of London much more objectionable than they could be in that valley." "Then," said counsel, "your conclusion is that, as you must have a London fog at one end, it would be convenient to have a country fog at the other; you would like to have the two termini alike!" An attempt was made to prove that Stephenson *père*, who was usually very conscientious

in his work, had not examined the route of Rennie's proposed line with sufficient care to be able to give a sound opinion upon it. "You went down on the top of the coach," said Mereweather to the great engineer, "with three persons in front, with a map and section before you; that was one examination; and the other was in a post-chaise, some part of the time being spent in getting a good lunch, and you got out of the chaise and walked now and then, to increase your appetites, all in one day?" "Yes," meekly replied the engineer.

The lawyers and agents could hardly desire a speedy selection of the line. The Parliamentary expenses of Sir John Rennie's project amounted to 72,000*l.*; Stephenson's, 53,750*l.*; Gibbs's, 26,325*l.*; while Cundy's amounted to 16,500*l.* only. If compared with the outlay over Bills in later years the sums will, however, appear exceedingly moderate.

The line selected was the combination of Stephenson's and Rennie's. It started from the London and Croydon Railway, at about 9¼ miles from London, and terminated at Church Street, Brighton. The length of the main line was over 42 miles, and the total distance to the terminus of the Greenwich Railway 51 miles 55 chains. The earthworks were soon found to be heavy. The excavations amounted to 6,861,683 cubic yards, or over 156,000 cubic yards per mile, exclusive of tunnelling. In July 1839 Mr. Rastrick reported that 4,769 men and 570 horses were employed; in the July of 1840 the numbers had increased to 6,206 men and 960 horses, with five contractors' engines.

Most of the bridges were constructed in brick, with stone dressings brought from the Heddon quarries, Newcastle-on-Tyne. On the original line, to which alone we are referring, the principal tunnels were those at Merstham, Balcombe and Clayton Hill. The Merstham tunnel is through chalk, which was raised to the surface of the ground by double horse-gins, one at the top of each of twelve vertical shafts, from whence the skiffs were moved on small trucks by means of tramways, and their contents deposited in spoil-banks. Mr. Rastrick described the ground in the Balcombe tunnel as very treacherous, requiring great caution on the part of the miners in working it, as "it swells and effloresces as soon as exposed to the air."

So many changes and additions were approved, it is difficult to calculate the cost of constructing the line. As well as it could be made out in 1840, it amounted to 37,568*l.* 17*s.* 6*d.* per mile. At the first meeting of the company the shareholders were assured, on the authority of Messrs. Rennie and Rastrick, and Mr. Locke, who represented Mr. Stephenson, that the cost would not exceed 23,376*l.* per mile. After so great an excess over the anticipated cost, it is no wonder so long elapsed before dividends were obtainable.

The growth of traffic was also under-estimated. As the *Times* correspondent says:—At the time when the proposed railway to Brighton was occupying the attention of Parliamentary committees, there were thirty-six coaches running between London and that town. These were unitedly licensed to carry 3,453 passengers per week, and their actual weekly average in the year 1835 was 2,263, or a total of 117,676 per annum. The average fare paid by each passenger was 21*s.* for inside and 12*s.* for outside seats, and the average time occupied on the journey was six hours. Two mail coaches ran daily, included in the thirty-six already named, and these made fourteen journeys per week, carrying nine passengers on each journey. There were, however, other distinct services between London and Worthing, Bognor, Horsham, Dorking and Epsom, as well as regular services between Brighton and Worthing, and between Brighton and Shoreham and Steyning. Finally, there was a special service of two coaches between Windsor and Brighton, which carried, on an average, 144 passengers per week, and occupied eight hours on the journey. The total value of the passenger traffic on these several services, including Brighton and London, was in 1835 about 123,300*l.*, and in the calculation of the traffic to be expected on the proposed new Brighton line it was believed that, at an average single fare of 8*s.*, the number of passengers to be carried by the railway would be about double that carried by the stage coach, which would give a total annual gross income from direct passenger traffic between the metropolis and the Sussex terminus of the line of 94,120*l.*, the total passenger income of the line being estimated at 156,000*l.* The direct passenger traffic to Brighton was, of course, expected to be the most productive source of income, inasmuch as the proposed line, although over fifty miles in length, did not pass through any populous places. Indeed, the whole population of the parishes on the line of route was given before the Lords' Committee of 1836 as only 35,200, Horsham with a population of 5,105 being the most important.

From these modest anticipations the Brighton Railway system has advanced until it stands to-day the fifth on the list of the great passenger-carrying lines of Great Britain, being exceeded in reference to the numbers carried only by the Great Eastern, the London and North-Western, the Great Western and the Lancashire and Yorkshire Railways. In 1890 the Brighton and South Coast Railway carried forty-three

and a half millions of passengers, or more than four hundred times the number estimated in 1835, while the gross income from passenger traffic, instead of being only 156,000*l.*, has been 1,650,000*l.*, or more than ten times as much, and that, too, with a very greatly reduced range of fares. It is true that only a comparatively small number out of this enormous number of passengers travelled between London and Brighton. Indeed, the average fare, instead of being a fraction over 7*s.* per journey, which was the estimated average of 1835, has only been about 9*d.*, which means, of course, that the great bulk of the traffic has been short-distance. But the Brighton fares have been very greatly reduced, so much so that the average third-class return fare is now less than the estimated single fare in 1835, and many thousands of passengers are annually carried from London to Brighton and back for a fare of 3*s.*, or one-half the estimated single fare at the time the railway was projected. Instead of having only fifty-eight coaches on the whole route between London and Brighton, including those that made journeys between intermediate places, the Brighton Company has now 2,198 passenger carriages, each capable of carrying about forty passengers per journey, as compared with nine passengers carried by the stage-coaches, and these are moved by no fewer than 410 locomotives belonging to the company, as compared with 250 to 300 horses employed on the turnpikes.

Marvellous as has been the development of the traffic in passengers, it has hardly been more so than the revolution that has taken place in the transport of goods and minerals, although the Brighton is not by any means one of our chief freight-carrying lines. On the contrary, it only stands twentieth on the list of such railways, and is excelled in respect of both mineral and general merchandise traffic by many lines of less extent and general importance. The total tonnage of goods traffic carried direct between London and Brighton in 1835 was stated before the Lords' Committee to be 7,280 tons, the average rate of transport being 55*s.* 6*d.* per ton, and the total annual traffic yielding a gross sum of 21,353*l.* The total traffic carried over the whole system of the projected railway in 1835, including Shoreham, Horsham, Dorking, Epsom and intermediate places of less account, was 143,665 tons, and the gross receipts were stated at 96,963*l.* In 1890, however, the total freight traffic carried on the Brighton system was 2,870,000 tons, and the receipts therefrom were 607,700*l.* The traffic had, therefore, increased to the extent of fully twenty times what it was in 1835.

THE WOOD-CARVING COMPANY.

THE Wood-Carving Company, Limited, lately formed—the registered office is in Birmingham—have produced a series of mouldings which will revolutionise the trade. The company very wisely do not propose to interfere with hand carving, but we must take the world as it is, and undoubtedly a large number of people who would be desirous of having handwork cannot pay the price; they may well be satisfied with the productions of the Wood-Carving Company as a substitute. The process is so effectual that the most delicate work can be produced. An example of the application of the egg and tongue as ornament shows as fine outlines as any artist could wish for, and the execution has the sharpness of delicate metal-work. The ornament of all styles, ancient and modern, can be reproduced not only with marvellous fidelity, but with a spirit that is uncommon in the work of the class. There is a large field for the application of the new carved mouldings, and many architects and builders will be glad to have such a process at command. Original designs can of course be produced as well as the forms which may be considered as standards of ornamental art. The mouldings are applicable in other ways besides in building. Already they are meeting with a ready sale, and the directors and shareholders deserve to be successful.

GUILDFORD SEWAGE SCHEME.

A PUBLIC inquiry was held at Guildford on the 9th instant, by Mr. Arnold Taylor, C.E., of the Local Government Board, on the application of the Guildford Town Council for sanction to borrow 35,000*l.* for purposes of sewerage and sewage-disposal works. The town clerk, who appeared in support of the application, said the matter had been very carefully considered by the Town Council for several years in order that the sewage might be disposed of without nuisance to anybody. So long ago as 1888 they appointed a committee which visited many places where sewage works were in operation, and came to the conclusion that the sewage should be dealt with by the system of the International Water and Sewage Purification Company, which they saw in successful operation at Acton. Under that system the sewage is first treated in precipitation tanks with ferozone to remove the solids, and is then passed through Polarite beds, such as are in successful use at Acton, Hendon, and other places. These polarite beds have a remarkable

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

effect in rapidly oxidising the organic matter in solution, and analyses show that this process produces a much purer effluent than can be obtained by any other process.

Mr. C. Nicholson Lailey, C.E., of Westminster, as well as other engineers (several of whom recommended the International Process), prepared plans for the scheme, and Mr. Lailey's plans were finally selected, and accordingly adopted, by the Sanitary Authority.

A large landowner having a residence near the proposed outfall works engaged Mr. Baldwin Latham to consider whether the purification works, as recommended by Mr. C. N. Lailey, were likely to cause a nuisance, and it was reported that he had no hesitation in saying that works of this character, if properly designed and carried out and attended to, could be made satisfactorily to deal with the sewage without the slightest nuisance arising even on the land itself. Sir Joseph Bazalgette also reported in favour of the scheme.

The inspector expressed his entire approval of the scheme, stating that it was necessary to have the best system, because the effluent discharged into the river Wey would ultimately reach the Thames above the water companies' intake. It is intended to proceed with the scheme without delay.

ECCUP RESERVOIR.

A VERY interesting stage has been reached, says the *Leeds Mercury*, in the work now being carried on at this reservoir. It will be recollected that some time ago serious leakage took place, the amount of water running to waste being calculated at about two million gallons per day. When measures were at first taken for dealing with this state of things, holes were bored in the hope that cement might be poured in such quantity into these receptacles that the waste of water might be obviated, or at least very materially lessened. This step did not meet with the success that was hoped, and the plan of excavating, with the object of ascertaining the condition of the puddle wall, was then agreed upon. This excavation has now proceeded so far as to discover pretty accurately the state of things the Waterworks Committee have to deal with. As will be remembered, large quantities of cement were used for the purpose above stated, no less than 33 tons being placed in some of the bore-holes. Strange enough, as it seemed at the time, the whole of this material disappeared, and it is now seen that it found a lodgment at or about the level to which the excavations have now reached On Friday last ridges of this cement, in one case no less than 90 feet in length, were brought to view, and it was seen that several of them ran right across the wall of puddle. These accumulations of cement are situated in what must have been fissures in the wall, and it is evident that the discolouration of the water, which at one time escaped from the reservoir, must have been due to the washing away of the puddle during its passage through these crevices. While a tolerable idea exists upon the manner in which the fissures were originally formed, it will remain for the next two or three months to declare with closer accuracy how the existence of the crevices came about, and why the puddle in the trench did not sink uniformly, so as to preclude the possibility of such fissures being made. It is believed that the work now in progress will shortly reveal the real nature of the defect for which search has been made. Altogether, apart from the quantity of water lost by leakage, it is clear that the wearing away of the clay structure could not have been allowed to continue, and altogether the Waterworks Committee and Mr. Hewson, the engineer, may be congratulated upon the self-evident results of their operations.

THE DRAINAGE OF NEWBURY.

THE Corporation of Reading having made complaint to the Local Government Board that the Corporation of Newbury had failed to provide their town with sufficient drainage, Mr. S. J. Smith, one of the inspectors of the Local Government Board, held an inquiry in the Council Chamber, Newbury, on Wednesday. The petition of the Reading Corporation to the Local Government Board having been read, Mr. G. M. Freeman explained that since 1879 there had been constant complaints to the Local Government Board from the Reading Corporation as to the lack of proper drainage arrangements at Newbury, and the great danger to the health of Reading caused by the outflow of the Newbury sewage into the Kennet. The Local Government Board had repeatedly sent communications to the Newbury Corporation on the subject, notwithstanding which nothing practically had been done to institute a remedy. In October, 1883, a Local Government Board inquiry with reference to the drainage of Newbury was held in that town, when a scheme, which had then been formulated, was approved, and sanction was given to borrow 25,000*l.* towards the cost of carrying out the works. Up to the present time, however, nothing effectual has been done to

remove the evils complained of. Mr. M'Intyre, on behalf of the Newbury Corporation, admitted that there were not sufficient sewers for the drainage of the town. His clients fully admitted that they were in default in this matter, and they were willing to submit to the inspector's order. The only question was the time which the Local Government Board would give them in which to begin and complete the works. After evidence by Mr. Walker, manager of the Reading Waterworks, and Mr. Anstie, the engineer, the inspector decided to allow the Newbury Corporation three months to carry out the preliminary arrangements for efficiently draining the town, and eighteen months to complete the works.

PUBLIC BATHS, ASTON.

ON Wednesday the foundation-stones were laid of a suite of public baths for Aston. The buildings will be situated in the Victoria Road, the site having been presented by Messrs. William & Edward Ansell. The design of the building is Classical Renaissance, and the material terra-cotta, similar to that employed in the Victoria Courts. There will be a frontage of 80 feet, and the elevation to the cornice will be 18 feet, and to the ridge of the centre pediment 40 feet. All the requisites of a modern swimming and washing establishment will be introduced, and these will include what will be known as a soap plunge-bath, to be used where necessary as a preliminary to a bath in the public baths, where soap will be forbidden. There will be first and second-class gentlemen's swimming-baths, and both baths will be set apart for ladies on particular days to be subsequently arranged. The first-class swimming-bath, which will be lined with white glazed bricks, will be 78 feet by 30 feet, and will have an area of 3,042 square feet. It will vary in depth from 3 feet 6 inches to 6 feet 6 inches, and there will be forty-three dressing-boxes, with brick partitions. The second-class bath will be 60 feet by 33 feet, with fifty-nine dressing-boxes. There will also be a number of private baths for ladies and gentlemen around the first-class bath. There will be a promenade gallery and a reserve gallery over the principal entrance, the two being capable of accommodating 500 people. The total cost of the buildings will be between 11,000*l.* and 12,000*l.*, and it is estimated that the site is worth 1,200*l.* The water will be derived from an artesian well, and will be pumped into a tank capable of containing 24,000 gallons. Mr. F. N. Stephen is the builder.

MUNICIPAL CONTRACTS.

THE report of a special committee appointed to inquire into alleged sweating in carrying out corporation contracts, and to consider and report as to a proposed fair-wage clause in future contracts, was discussed at last week's meeting of the Liverpool City Council. The committee recommended that each person or firm applying to be placed on the list of corporation contractors be requested to sign an undertaking to pay the rate of wages and observe the hours of labour recognised and agreed upon between the trade unions and employers respectively in the locality in which the work for carrying out the contract is to be performed, or such a rate of wages and hours as are equivalent or approximate thereto, so that they will not transfer, assign or underlet, directly or indirectly, the contract or any part, share or interest therein without the written consent of the corporation, under the hand of the town clerk, and that they agree to a condition being inserted in the contract to carry out this undertaking. When Mr. Houlding, the chairman of the committee, moved the adoption of this recommendation, an amendment was moved to leave out the words "or such a rate of wages and hours as are equivalent or approximate thereto." The amendment was rejected by twenty-five votes to three, and the recommendation was adopted. Contractors who fail to comply with the covenant may be struck off the list of corporate contractors. The Watch Committee are to consider the desirability of arranging "the acceptance of contracts for such periods as will enable Liverpool tradesmen to compete on equal terms with those of other towns."

THE SIMPLON TUNNEL.

THE project of tunnelling the Simplon has at last taken definite form, and an official report has been issued by the Jura-Simplon Railway Company, of whose line, now terminating at Brigue, it would form an extension. It is proposed to start the boring for the tunnel, which is to be one of 12¼ miles—or three miles longer than that through the Gothard—on the northern side of the mountain at a height of 687 mètres just above Brigue. Thence it will rise at a gradient of 1·5 per cent. to 701 mètres at the centre of the tunnel, and then drop at an incline of 6·5 per cent. to the southern side, where the opening will be made upon Italian territory at a height of 634 mètres,

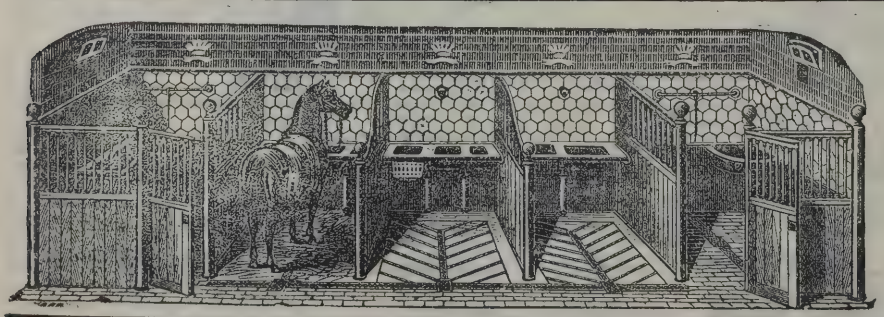
near Iselle. This is but ten miles from Domo d'Osolla, the existing terminus of the Italian Mediterranean Company's branch, which runs thence to Novarra, Turin and Genoa. The cost of the approaches to the points proposed for the openings of the boring will, therefore, be comparatively small—170,000*l.* out of the 3,000,000*l.* which it is estimated the line would cost. An interesting feature of the project is the proposal to divide the tunnel at half distance. That is, from Brigue to the centre it will consist of a single boring large enough to receive a double line of rails ; then it will be divided into two smaller tunnels, running parallel, and each containing a single line of rails. This plan has been conceived as the best and most economical for ventilation purposes. An exhaustion shaft is to be made at the highest part of the boring, where the tunnel divides, and at which point the volume of smoke and obnoxious gases will naturally be greatest.

The mouth of one of the parallel tunnels will be kept closed except to allow of the passage of trains coming up from Iselle, whilst the mouth of the other tunnel, as well as that at the Brigue end, will be left open. In this way the engineers expect to obtain not only adequate but much cheaper ventilation than would be obtained by making a single tunnel. The Rhone on the Swiss side and two smaller rivers on the Italian side of the mountain will provide the motive power necessary for the air-pumps during the work of construction and subsequent working of the tunnel.

WESLEYAN CHAPEL, CROSBY.

THE Wesleyan chapel and school premises which have been in course of erection in Mersey Road, Crosby, Liverpool, during the past year, have attained completion. The amount of the contract for the works was 8,352*l.* 3*s.* 10*d.* The chapel is cruciform on plan, with wide nave, 70 feet by 41 feet ; transepts, 26 feet by 14 feet 6 inches ; octagon-ended chancel, 28 feet 6 inches by 21 feet 6 inches, with spacious organ-chamber, 22 feet by 16 feet, with large arched openings to both chancel and transepts. The principal entrance is approached from Mersey Road, and consists of an east and west porch, with a connecting narthex, the size of the narthex and porches being 55 feet by 11 feet. The tower and spire, 110 feet high, is placed at the north-east angle of the church, and forms one of the entrances. The north-west porch contains a staircase to gallery over the narthex. At the south-west angle of the church are the various classrooms, vestry and corridor connecting the church with the lecture-room at the south end of the site. The lecture-room is the same size as the old chapel removed from Great Crosby, the bold Norman doorways, east window, roof timbers and much of the material and masonry being reused in this part of the work. The size of the lecture-room is 53 feet by 30 feet. The room has four entrances, minstrels' gallery and spacious kitchen, fitted with every requisite for the purposes desired. The style of architecture adopted by the architect is the transitional period between Decorated and Perpendicular. The materials used in the erection of the edifice externally are Yorkshire stone shoddies and Storeton stone dressings. The roof principals are constructed with hammer-beams, and the spaces fitted with tracery deeply moulded, giving a very bold and rich effect to the interior of the church. This effect is assisted by the double arches to the windows in the various walls. The effect of the chancel is considerably heightened by the richness of the choir seats, the mosaic pavement in chancel and communion space, Caen stone arcading below the sills of the chancel windows, which are filled in with rich stained-glass. The carving has been the work of Mr. J. Rogerson, and the stained-glass and enriched grisaille work has been executed by Mr. J. A. Heaton. The mosaic work has been executed by Mr. G. Swift. The church will accommodate about 650 people. There are five spacious classrooms and vestries, with all necessary sanitary conveniences. The lecture-room will accommodate 300. Mr. J. F. Doyle was architect, and Mr. Webster, of Bootle, contractor.



ARDROSSAN HARBOUR EXTENSION WORKS.

THE works in connection with the extension of Ardrossan Harbour, which have been in progress for the last four years, are now nearing completion, and it is expected that the new portion of the harbour will be opened for traffic within a few weeks. The works consist of a new dock of about 10 acres, a tidal basin about 5 acres in extent, and a considerable extension of the quay accommodation for passenger steamers and other traffic outside the docks, with a wide channel between the entrance to the harbour and the tidal basin. The whole extension is protected by a new breakwater about 1,400 feet long. All these works are nearly completed with the exception of a portion of the dredging which still remains to be done, and also a small piece of one of the quay walls, but with favourable

weather it is hoped that everything will be sufficiently advanced to admit of the dock being opened for traffic in the course of a month or six weeks. The depth of water and width of entrance of the new dock are such as to enable the largest vessels employed in the class of traffic done at the harbour to make use of this port. The work has been divided into seven or eight contracts, including the general contract, hydraulic machinery and houses contracts, timber, pier and sewer contracts, &c., and the whole works have been carried out under the supervision of Messrs. Strain, Robertson & Thomson, civil engineers, Glasgow.

BUILDING AT EAST GRINSTEAD.

THE employment of bricks and mortar at East Grinstead just now is truly remarkable, says the *Sussex Daily News*, for the demand for houses of all descriptions appears to increase rather than to show any signs of ceasing. On all sides of the town extensive estates are being developed, and the foundations are scarcely laid before a house-hunter is on the scene to arrange for a tenancy with the owner. The transfiguration of the Chequer Mead Estate is watched with, perhaps, the greatest amount of interest, mingled somewhat with feelings of sorrow. The Chequer Mead has, since the memory of any living inhabitant, been the recreation-ground for the children of East Grinstead. Cricket and football have been played there, childish romps have been indulged in there, and it has always given harbour to the circuses and other peripatetic shows. People have come to look upon the Mead as their own property, and it has been divided by footpaths in all directions. But since it has been acquired by Mr. Steer from Lord Delawarr, the pleasant field, with its border of fine elms, has undergone a transformation, and is now crossed by three broad roads, which ere long will be lined with houses.

THE STRENGTH OF MATERIAL.*

IT is not usual to consider the work of the fireman as professional; but, nevertheless, in some respects it resembles that of the physician. When taken suddenly ill we telephone at once for a doctor, who, though a stranger, is expected to not only know the disease and its remedy, but also to understand the individual constitution of his patient, and recognise at once its weaker parts—those in which the disease is most likely to get beyond control; so the fireman, when called to action, is supposed to be able to recognise at a glance the weak points of a burning building, and at the same time discern all the natural channels it affords for fire; but, as fortune will have it, the mistakes of the doctors are buried, and those of the fireman are burned.

Engineers, with plenty of time for mathematical investigation, find it very difficult to determine with certainty which are the weaker parts of a building, and to ascertain positively their actual strength; how, then, can a person in a burning building determine in which part the fire can be fought safely and most successfully? The circumstances render imperative that this must be wholly a matter of judgment, therefore a few hints that are calculated to assist the judgment and render it more reliable will not be out of place here. It may be improved by cultivation and close observation, and for this purpose it may be well to fix in mind a few facts, and this may be done without taking a regular course in a technical school. In estimating the strength of different parts of buildings, it should be borne in mind that beams decrease in strength much faster than the length is increased. For instance, if a beam of any given size, 20 feet long, will sustain a load of 100 lbs. per foot, one of the same size and 40 feet long will sustain only 25 lbs. per foot, and that with much more deflection, while the same beam cut down to 10 feet in length would carry 400 lbs. to each foot in length.

With posts, the ratio of strength to their lengths differ somewhat with different materials and different proportions, but roughly speaking, posts of sizes in common use diminish in strength as they are increased in length in a ratio of about $\frac{1}{3}$ to 2—that is, if a post of a given size and 10 feet long is capable of supporting 12 tons, one of the same material and size, but 20 feet long, will support but 4 tons. The comparative strength of rods sustaining loads by suspension is not materially affected by their length; a long rod of a given size is nearly as strong as a short one of the same dimension.

Now with these general principles in mind let us remember as a base for calculations a few examples. Take first a mill 50 feet wide, three 10-feet storeys in height, of the usual "mill construction," centre posts and beams 8 feet between centres, making the beams 25 feet long from posts to wall. To safely carry the ordinary load of 100 pounds per square foot the beams

* A paper read by F. R. Richmond before the nineteenth annual Convention of Fire Engineers held at Springfield, Massachusetts.

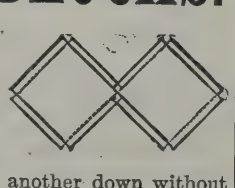
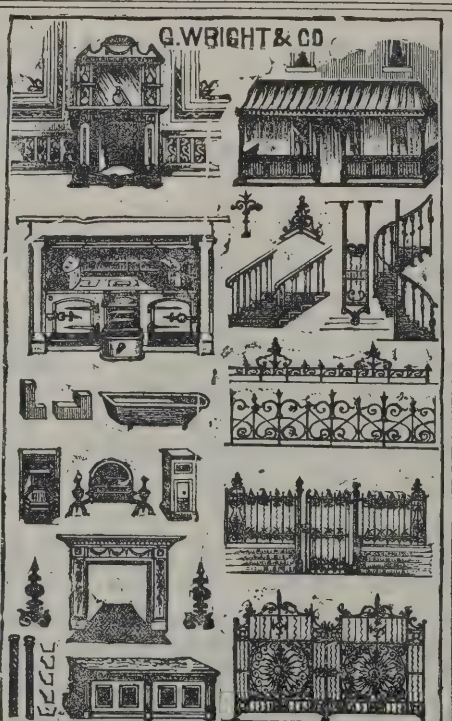
should be of Southern pine 12 by 16 inches, with round posts 11 inches in diameter or 10 inches square; posts in the first storey to support the second and third floor and roof; 10-inch round post or 9 by 9 in the second storey for the support of the third floor and roof, and 9-inch round or 3-inch square to carry the roof. A 15-inch I-beam 150 pounds per yard this length would be of about the same strength as the 12 by 16-inch beam. A 6-inch round wrought-iron column of $\frac{5}{8}$-inch shell or a 6-inch cast-iron column free from defects with a $\frac{1}{2}$-inch would be about the same strength as the 10 by 10-inch posts, cast-iron being stronger in columns than wrought-iron, except where they are very slender. Iron will not resist heat as long as wood, wrought-iron becoming soft and pliable and iron cracking with heat and water. If a brick pier is to carry the load or 10 by 10-inch posts it should be of good masonry 2 feet square, or at least 20 by 24 inches, and it will resist the action of heat longer than any other of the materials mentioned. A $1\frac{3}{4}$-inch iron rod will safely support by suspension the same amount of floor surface of a single floor as is carried by one of these posts.

If it is desired to use this building for a warehouse, to be filled with barrels of flour, it should be estimated at 400 instead of 100 lbs. to square foot, and it would require another row of posts between the centre post and each outer wall, thus making the beams about 12 feet between bearings, the beams remaining the same size and the post increased a little, the wood about 1 inch or $\frac{1}{2}$ inch for the iron.



Now let us consider another type of building, a warehouse intended to be filled with flour making 400 lbs. per foot. Suppose the building to be 30 feet wide, and in height three storeys of 10 feet each, with joists running crosswise, and under them a centre beam running lengthwise of the building with posts to support this beam. The joists placed 10 inches between centres should be 4 by 14 inches and the beam supported with posts 10 feet apart should be 12 by 16 inches. The posts should be 12 by 12 in the first storey, 10 by 10 in the second and 3 by 3 to carry the roof. If cast-iron columns are used in the first storey they should be 7-inch diameter with $\frac{3}{4}$-inch shell, and wrought-iron of the same thickness shell should be 9-inch diameter and a well-built brick pier should be 2 feet 3 inches square. As brick piers are liable to split under heavy pressure they should have strong bond stones every 3 or 4 feet in height.



If the building as described above is to be loaded only 100 lbs. per foot, the joists would be $2\frac{1}{2}$ by 10, placed 18 inches between centres, the beam 10 by 12, and the first-storey posts 8 by 8 or 5-inch diameter $\frac{1}{2}$-inch shell iron column, the posts above 7 by 7 and 6 by 6. The timbers are all estimated for Southern pine, but if spruce is used instead it will safely carry about 4·5 as much load. Take a store 40 feet wide with a row of columns in the centre 12 feet apart and above the store four storeys of rooms to be used as offices or chambers. The joists should be 3 by 12, placed 16 inches between centres, and the columns should be 12-inch diameter if of Southern pine or oak, or if of cast-iron 7-inch diameter $\frac{3}{4}$-inch shell. If all the materials mentioned were free from defects and rightly set, it would require to break any of them about six times the load assigned to them.

The strength of brick walls is largely increased by buttresses, breaks, cross walls and other lateral supports, and decreased by openings, so that a thickness that would be very strong under some circumstances would be weak under others; but straight, solid, well-built walls commonly should be 12 inches thick in the two top storeys, 16 inches for the two storeys next below, 20 inches for the fifth and sixth from the top, 2 feet below these, so on, increasing 4 inches for each two storeys downward, and of course warehouses and buildings for heavy uses should have thicker walls, while ordinary partition walls built near together may be thinner. Arches in brickwork are very strong if sufficient provision is made for sustaining their thrust, but often the bottom of arches spreads and the brickwork above cracks, and too often solids are placed over openings with openings over solids, thus concentrating large loads on small portions of masonry, resulting in the cracking of the walls.

A $\frac{1}{2}$-inch rod may be safely relied upon to carry 1 ton; a 1-inch rod, 4 tons; a 2-inch rod, 16 tons, and a 3-inch rod, 35 tons, and, if of good quality, it would require six or seven times this to break them with a suitable truss to sustain the upper end. To discuss the strength and strains of different parts of the different styles of trusses would make too long an article for this place, but as a rule the weakest place in a truss is at the joint of the bottom of the braces to the tension cord. When a fireman is called to enter a burning building, he has no time to remember and apply all these figures, but by fixing these and others in his mind and improving his daily opportunities to estimate the strength of different buildings, searching out their weak points, he will acquire the habit of judging at sight the relative strength and safety of buildings, and cultivate his judgment so that it will be of great value in cases of emergency.

BRISTOL MASTER BUILDERS' ASSOCIATION.

ON Saturday the president (Mr. E. T. Hatherly), Messrs. James, Scull and Cowlin (members of the Association), and Mr. Henry J. Spear (secretary), and Mr. Perry (the instructor of the plumbing class) attended the schools of the Society of Merchant Venturers for the purpose of adjudicating upon the work of the students during the past session. Two prizes were awarded to the following for the best sets of practical work executed in the school workshop—the first to John W. Holbrook, and the second to Francis J. Cann. The adjudication of prizes in the carpentry and joinery classes was deferred for a week.

AN AMERICAN TRADE SCHOOL.

THE following are the regulations of the trade school of the Pratt Institute, Brooklyn, N.Y. :—

Applicants must be between sixteen and twenty-five years of age. All tools and materials are furnished without extra charge. Day and evening classes.

Carpentry.—Practice is first given in the use of saws, planes, chisels and laying-out tools, and is followed by a thorough course in joint-work. After this practice, and when some mastery of the tools has been gained, a model of a frame-house is made and the different methods of framing illustrated. Afterwards partitions are set and bridged and floors laid. Door and window-frames are made and placed in the partitions, which are sheathed, clapboarded, shingled and corniced. Lastly, inside trimming is taken up ; doors, sashes and shutters are made and hung ; wainscoting, baseboards and stairs built, &c. Constant practice is given in the use of working drawings and in laying out work from plans.

Plumbing.—The plumbing shop is equipped for about fifty pupils, each member having a gas furnace for melting solder, and a drawer holding a set of tools. Instruction is both practical and theoretical, lectures being given from 8·30 to 9·30 o'clock every Wednesday evening. The manual work includes the use of tools, preparing wiping cloths, making soil, tinning soldering iron, brass, iron, lead and tin, making solder, soldering seams, making cup-joint, over-cast joint, straight wiped-joint, flange joint and branch joint, working sheet lead into bends, traps, service boxes and safes, lining tanks, calking iron pipe joints, and bending with sand and kinking irons. The lectures deal with the proper arrangement of drain, soil and waste pipes, trapping and ventilating the same, supply pipes, boilers, tanks, fixtures, pumps, and also explain mistakes in plumbing.

House and Fresco Painting.—The Master Painters' Association, of Brooklyn, co-operates in the direction of the painting classes, and at the end of the term examinations are held and certificates granted, with their approval. The equipment for the house-painting class consists of screens containing doors, windows and wainscoting, and, for the fresco workers, of booths, plastered on sides and ceiling, with varied forms of cove and cornice.

Blacksmithing.—The instruction includes care and management of fire, operations in drawing, upsetting, forming and welding iron, and making and tempering steel tools. The exercises mainly represent useful pieces of work and several complete designs in ornamental work finish the course.

Machine Shop (two years' course).—Bevel, surface and key-way chipping are first practised, after which the class is put upon straight-surface filing until ability to file straight and true is obtained. This is followed by straight, tongue, round and dovetail fitting, freehand filing, filing to templet, making calipers, square, bevel and gauges in sheet steel, use of taps and dies and practice in scraping. The toolwork gives practice on the engine-lathe in plain and taper-turning, outside and inside screw-cutting and fitting. After this, exercises are introduced in hand-turning, and varied practice on the planing-machine, shaper, drills, milling-machine and grinding-machine is obtained. The theory of cutting tools is analysed and the construction of the different machines explained.

Bricklaying.—The men are first taught to handle the trowel and to spread mortar. Practice is then given in building 8, 12 and 16-inch walls, with square and blocked ends, and with returned corner ; afterward, arches in walls of the same size are constructed, and later, flues, fireplaces, setting sills and corbelling. At first each man works on a separate section of the wall, and no attempt is made to do rapid work, but toward the end of the course a number of men are placed side by side on a long wall and greater speed is attempted. Instruction is given by means of lectures upon the strength of walls, theory of arches, properties and proportions of mortar, cement, &c.

Plastering.—Instruction is given in scratch-coating, laying off, browning and hard finishing, and in running and mitreing

ESTIMATES, PRICE LISTS, CATALOGUES, &c.

small mouldings and cornices. The booths for plastering are formed of stud partitions, lathed in the usual manner, and arranged to present the conditions of an ordinary room. The use of hawk and trowel is first taught, and the scratch-coat is then applied. This is afterwards taken off, and the walls are next covered by laying-off, and practice obtained in the use of darby and rod. After this practice in browning is given on the hard and dry scratch-coat, and this is followed by considerable practice in finishing with sand mortar to prepare for hard finishing. Running and mitreing simple cornices are taught last.

House Painting.—The house-painting course includes both elementary and advanced classes ; the former having practice in the preparation of surfaces, mixing paints, and plain painting on wood, brick and plaster surfaces ; and the latter in varnishing and hardwood polishing, polish white, gilding, lining, graining and paperhanging. Lectures are given on the harmony of colours, mixing of colours, proportion of oils and driers, and the various materials used in painting.

Sign Painting.—A special class in sign painting will be organised next year. The instruction will include preparation of surfaces, spacing and plain lettering, followed by ornamental lettering in gold and colours, and painting on glass and metal.

Fresco Painting.—Instruction is given preparing walls and ceilings for calcimine, in lining, laying out work, making and applying pounce and stencil, and in putting on flat and shaded ornaments.

Advanced Fresco Painting.—Applicants are admitted only on approval of some member of the Master Painters' Association, or after giving satisfactory proof of proficiency in plain fresco painting. Instruction is given by alternate practice in drawing and colouring designs in the art department, and in applying the same in fresco to the plastered wall.

THE IRON TRADE.

THE customers of the New British Iron Company, Corngreaves, one of the largest firms in the Midlands, have received circulars announcing an advance in the price of ordinary iron of 5*s.* per ton, with the usual differences on the firm's "cable" and other better qualities. This advance applies to bars, nail rods, &c. The Gas-tube Strip Iron Association have also resolved to give notice for an advance over the present prices of 5*s.* per ton, making the new quotation 6*l.* 10*s.* The notice will have to be considered by the National Tube Makers' Association, but there is not much probability that they will refuse the advance. Letters have been issued by Messrs. Roberts & Co., West Bromwich, withdrawing all quotations for bars and strips and similar iron, and other firms are taking like action. Producers of merchant iron are demanding 2*s.* 6*d.* to 5*s.* per ton rise on all orders, and merchants have no alternative but to pay it. Circulars are shortly expected from merchants, advancing prices 10*s.* per ton.

LIMESTONE INDUSTRY IN THE UNITED STATES.

THE United States Census Bureau has recently issued a bulletin showing the extent and value of the limestone industry in that country. It shows that ordinary limestone, to the value of 19,095,000 dols., was produced during the census year from 1,954 quarries, by a force of 30,644 men, who received in wages a sum amounting to 10,122,000 dols. The total expenses in producing the limestone amounted to 15,093,000 dols., giving a profit to the producers of 4,000,000 dols. The capital invested amounted to 27,022,000 dols., of which 14,771,000 dols. are invested in land. The various purposes for which limestone is used and the extent to which it is employed in the various industries, are shown in the following figures :—Building purposes, 5,405,671 dols. ; converted into lime, 8,217,015 dols. ; stone, for burning into lime, 184,000 dols. ; flux, for furnaces, 1,569,300 dols. ; street-work, 2,383,000 dols. ; bridge, dam and railroad work, 1,290,000 dols. ; and miscellaneous uses, 46,000 dols. In stating the amount of lime, the figures are limited to that manufactured by producers of limestone, and do not include lime produced by lime-burners, who purchase stone from quarrymen and burn it into lime. Limestone is produced in 39 States and two territories ; but nearly two-thirds of the value of the product is confined to seven States. These seven States are Pennsylvania, Illinois, Indiana, Missouri, New York, Maine and Ohio, and the value of the product in each is in the order of the States named. Pennsylvania heads the list with 373 quarries, and a production valued at 2,655,000 dols. Illinois comes next, with 104 quarries, and a product valued at 2,191,000 dols. ; Indiana, 172 quarries, value of product, 1,889,000 dols. ; Missouri, 123 quarries, value of product, 1,860,000 dols. ; New York, 157 quarries, value of product, 1,708,000 dols. ; Maine, 60 quarries, with a value of 1,523,000

dols.; and Ohio, with 221 quarries, and a product valued at 1,515,000 dols. These are the only States in which the value of the product reaches 1,000,000 dols. annually. In Wisconsin the value is 813,963 dols.; Minnesota, 613,000 dols.; Iowa, 531,000 dols.; California, 517,000 dols.; Kansas, 478,822 dols.; Alabama, 324,814 dols.; and Kentucky, 303,314 dols. Maine heads the list in the value of lime produced; yet Pennsylvania produces more than twice the quantity produced in Maine. The main product comes entirely from Knox county, where large quarries of very pure limestone are worked exclusively for conversion into lime. Pennsylvania produces 4,043,679 barrels of lime, while the production of Maine is 1,903,639 barrels. The value of the Maine output is 1,523,499 dols., while that of Pennsylvania is only 1,195,955 dols. This great difference in the relative value of the product of these two States is accounted for by the fact that a large proportion of the lime produced in Pennsylvania is used for agricultural purposes, which require only inferior descriptions; whereas the lime from Maine is almost entirely used for building purposes in many of the principal cities on the Atlantic coast.

INSPECTION OF PLUMBING WORK BY PRACTICAL PLUMBERS.

THE Mayor presided at the last meeting of the Public Health Committee at Cork. Mr. Barry Galvin, the executive sanitary officer, said the following portion of the report of Mr. Constantine, registered plumber, who had been recently appointed by the Waterworks Committee to inspect the fittings of No. 2 Area, had been read at the meeting of that committee, and had been ordered to be brought before the Public Health Committee:—"Out of a total of 118 houses inspected, I should hesitate to pronounce more than 16 or 18 to be in a fair sanitary condition, and while the authorities permit such a state of things to exist, no effort of yours will succeed in materially reducing water waste, as the inhabitants, knowing no better, will persist in letting the water flow as the only method they know of to keep down the horrible effluvium arising from defective fittings."

Dr. Donovan, the medical officer of health, said the report of Mr. Constantine showed the necessity for having practical plumbers as sanitary inspectors. He suggested to the Public Health Committee that the next vacancy which occurred in the staff of sub-sanitary officers should be filled by a competent plumber, whose time would be well occupied in looking after the proper construction and repairs of the water-closets in the city. If this had been done earlier, a good many of the defects now found would not exist. They could not expect an outsider who was not a plumber to be able to supervise plumbing defects and get them remedied.

It was decided, after a lengthy discussion, that Dr. Donovan's suggestion should form the subject of a conference between the joint committees.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

"CLIMAX" Louvre Ventilator

From 10/

Ridge Ventilator

Illustrated Catalogue etc., Post Free on application.

EXTRACT FROM LETTER OF AN EMINENT ARCHITECT.

"Having used every Ventilator of any prominence, I recently tried yours, and am satisfied it is the best in the market. An important feature is that your appliances are an effective addition to a building instead of an unsightly drawback as hitherto."

CLIMAX VENTILATING CO., 15 Great George Street, Westminster, S.W.

Printed by SPOTTISWOODE & CO., at No. 5 New Street Square, E.C., and published for the Proprietors by P. A. GILBERT WOOD, at the Office, No. 175 Strand, W.C. London.
Friday, September 25, 1891.

A Business Supplement

The Contract Reporter.

to The Architect.

LONDON, OCTOBER 2, 1891.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

IMPROVED

FLAT BRICK FIRE-PROOF FLOORS.

Transverse Section.

Longitudinal Section.

NO THRUST ON WALLS.

The BEST as well as the CHEAPEST Fire-proof Floors yet introduced.

THEY are constructed with purpose-made hard-burnt bricks, with moulded projections protecting the iron, and provided with wedge joints throughout, forming the most compact and solid floor known

The soffits of the bricks are specially prepared to key up the ceiling plaster. No laths or counter ceiling are necessary. They are not affected by water, acids, or alkalies, and they may be fixed during the progress of building, thus dispensing with the use of internal scaffolding.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost of a building with floors of this construction does not exceed that of one with the ordinary combustible timber floors of corresponding strength.

HOMAN & RODGERS,

Engineers and Patentees,

17 GRACECHURCH ST., LONDON, E.C., & 10 MARSDEN ST., MANCHESTER.

TRADE NOTES.

THE work of illuminating Studley Royal, the Yorkshire seat of the Marquis of Ripon, with the electric light has been successfully completed under Mr. S. Harrison, engineer, by Messrs. Woodhouse & Rawson United, electrical engineers.

THE *Irish Times* says:—It is gratifying to observe, from the reports of the meeting and exhibition of work of the British Institute of Coach Builders which was held at Derby last week, that Irish artists and workmen still take a leading place in the important work of heraldic painting. At this exhibition, in the class which provides for the painting of an heraldic device upon a carriage panel, Mr. Alfred E. Stone, of Clonliffe Road, who for many years has been connected with the well-known firm of John Hutton & Sons, of Summer Hill, gained first prize for the exhibit submitted by him, the design being the coat of arms and armorial bearings of Lord Zetland. It has been decided to send the panel to Melbourne for exhibition.

THE Edinburgh Corporation have commissioned Mr. Howden, marine engineer, Glasgow, to prepare an estimate of the probable cost of a destructor with the application of his hot blast system.

THE new schools, Walshaw, near Bury, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

A FINE large clock has been erected in the new tower of the parish church at Lymm. Out of tenders from the principal clockmakers in England, that of Messrs. William Potts & Sons, of Leeds, was selected. The clock is constructed from the designs of Lord Grimthorpe. It has the double three-legged gravity escapement, compensation pendulum and all latest improvements. The hours are struck upon the tenor bell of the peal, which weighs 30 cwts., by a hammer of about 70 lbs., which is raised by steel-faced cams from the large wheel. The clock also strikes the full Cambridge or Westminster four quarters upon the second, third, fourth and seventh bells. It has one external dial of 5 feet 6 inches in diameter, which is of an ornamental character, made from the designs of the architect of the new tower. It is of skeleton form, so that the stonework can be seen through it, and forms the background. The dial is made of cast copper of great thickness, fitted together in sections and along with the hands is thickly gilded. The clock was started by the donor, Miss Fox, in the presence of a numerous assembly, including Mr. James Potts, of Leeds (representing the makers of the clock), and Mr. Taylor, jun. (the bellfounders), and a large congregation. Messrs. Potts & Sons, Leeds, the manufacturers, have made many of the most important clocks in the country, amongst which may be mentioned the Town Hall, Preston; Town Hall, Bolton, which has four dials 12 feet each in diameter and strikes the hours upon a bell of 4 tons; Rochdale Town Hall; Manchester Central Station, two dials 12 feet each in diameter; Dewsbury

BRITANNIA TIN AND COPPER WORKS.
TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,
We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4s. 6d. and 6s. each. Household and Fancy Filters, from 10s. Water-Testing Apparatus for detecting Impurities in Water, 10s. 6d. and 21s. each.

Portable Cistern Filters.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

Town Hall; Wakefield; Sunderland; Burnley; Lincoln Cathedral, which strikes the hours upon the large bell (Big Tom), 5 tons, 8 cwts., and is considered one of the finest and most accurate timekeeping clocks in England. The firm has also made many others for different parts of the kingdom and abroad.

NEW iron and steel works have been opened at Wishaw by the Belhaven Iron and Steel and Patent Nail Company, Limited, on a site adjoining the company's nail works. Ten puddling furnaces, two heating furnaces and three rolling mills have been laid down, together with other modern appliances used in the manufacture of iron and steel. Plates, strips and bars will be turned out for the home and foreign trade, and bevelled strips will be supplied to the nail works. The start has been made with nearly fifty hands. When fully occupied, the works (inclusive of the nail department) will give employment to 300. The cost of building, plant, &c., is estimated at 30,000*l.*

TERMS have been adjusted for a settlement of the dispute between Aberdour and Inverkeithing as to their water-supply. It is proposed that the present litigation be superseded; that it be remitted to Mr. R. Carstairs Reid and Mr. J. D. Parker, two of the skilled witnesses, to determine what new works or alterations upon the present works ought to be executed for the purpose of securing to both parties a full and adequate supply of water, and that the whole expenses of the works to be so determined and also the expenses incurred by both parties in the litigation be borne mutually in the proportion of seven-tenths by Inverkeithing and three-tenths by Aberdour.

THE Dundee Gas Commissioners have appointed a London firm of electrical engineers consulting engineers in connection with the installation of electric lighting in the city. The works, which are to cost about 20,000*l.*, are to be proceeded with at once.

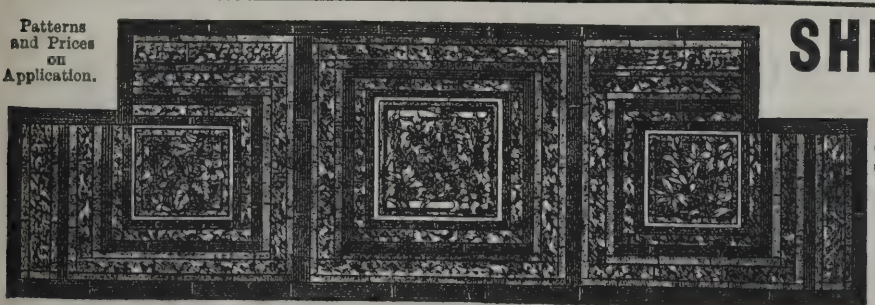
A LARGE turret-clock has just been completed by Messrs. Gillett & Johnston, clockmakers and bellfounders, of Croydon, at the fire station, Chiswick. The clock is constructed to strike the hours on a bell and shows the time on four illuminated dials, each measuring 3 feet 6 inches in diameter. It is made of the best materials and workmanship, and has all the latest improvements. The same makers have also just finished a large clock at the parish church, Farnham Royal, Bucks. The clock is of best materials, and has all latest improvements to insure perfect timekeeping. It has all gunmetal wheels, solid steel pinions, &c., and is fitted with the double three-legged gravity escapement and compensated pendulum. The clock is constructed to strike the hours and show the time on two dials. Messrs. Gillett & Johnston are now engaged on a large clock, carillon machine and peal of bells for Largs U.P. Church, N.B., to the order of Mr. John Clark, of Paisley. They have also in hand large clocks for St. Philip's, Kensington; Newnton Longville parish church; Coniston parish church; Rathkeale Church, co. Limerick; Karachi clock tower, India, &c., and are rehanging the bells at Tetbury Church, Gloucestershire.

FOR warming the new portion of the premises of St. Olave's Union, Rotherhithe, sixteen of Mr. John Grundy's patent warm-air ventilating fire-grates have been specified.

THE Wood-Block Flooring Company have removed from 22 Charing Cross, S.W., to Mansion House Chambers, 11 Queen Victoria Street, E.C.

NEW premises have just been erected in Oxford for the Metropolitan and Birmingham Banking Co. The whole of the plastering has been carried out by the Adamant Co., of Commercial Street, Birmingham, their patent adamant plaster having been used throughout the building.

THE Shardlow Guardians lately advertised an open competition for the best scheme for the sewerage and sewage disposal of Castle Donnington. Mr. W. H. Radford, C.E., of Nottingham, has just been awarded the first premium, and a vestry meeting of the ratepayers will shortly be held to consider the desirability of carrying out the scheme at once. The population is about 2,500, and it is proposed to deliver the sewage by gravitation on to 10 acres of suitable land, where it will be purified by irrigation. The storm water from roads will not be admitted to the sewers. Part of the outfall sewer will consist of an iron pipe syphon 750 yards long. The cost of the engineering works is estimated at 2,300*l.*



THE *Aberdeen Press* says that Harpers, Limited, Albion Iron Works, have acquired from the Aberdeen Land Association six acres of ground on the farm of Craiginches, Nigg, opposite the loading bank of the Caledonian Railway, and with a frontage of 900 feet to the public road, for the purpose of erecting new and extensive works.

AT a special meeting the County of Zetland Road Board at Lerwick had before them the appointment of a road surveyor for the county. There were over fifty applicants for the office. Mr. Alexander Ross, Aberdeen, was appointed. A report was submitted, showing that in order to provide a proper system of

roads throughout the county an expenditure of something like 15,000*l.* or 20,000*l.* would be required. The meeting agreed to recommend to the County Road Trustees the construction of twenty-two new roads in various parts of the county at a cost of between 6,000*l.* and 7,900*l.*

WITH reference to the notice issued by the Foreign Office respecting tenders for the new pier at Yokohama, persons wishing to tender for the work are informed that further papers —including drawings—can now be seen at the Commercial Department of the Foreign Office, S.W., between the hours of 11 and 5.

TENDERS will be received by the Mayor of Galatz for the construction of tramways in that town, up to November 15–27. Particulars may be obtained of the Mayor. A further notice will be issued when copies of the specifications reach the Foreign Office, London.

THE Belgian Government will receive, up to March 28, 1892, tenders for the construction and maintenance of a new sea-port at Bruges, and for a line of steamers under the Belgian flag to run to the new port. The conditions may be seen at the Commercial Department of the Foreign Office between the hours of 11 and 5.

NOTES FROM CHICAGO.

THE report of Chairman Jeffery, of the Grounds and Buildings Committee to the Exhibition Directory, which was submitted to the National Commission for information at its September meeting, contained among other matter the following :—

Contracts have been let for the buildings as follows :—Administration, 450,000 dols. ; manufactures, 1,000,000 dols. ; agriculture, 540,000 dols. ; machinery hall, 1,200,000 dols. ; electricity, 375,000 dols. ; mines and mining, 260,000 dols. ; transportation, 260,000 dols. ; horticulture, 300,000 dols. ; fish and fisheries, 200,000 dols. ; woman's building, 120,000 dols.

There remains to be let for all of these buildings contracts for annexes and roofing, the grand entrances, interior finish and decorations, as well as lighting, plumbing, &c.

The casino and pier will cost 150,000 dols. The fine art palace will cost 500,000 dols., and contracts for these have not yet been let.

Your committee herewith estimates for the completion of the necessary buildings, machinery, decorations, administration and maintenance up to the date fixed for the opening of the exhibition as follows :—Buildings, 7,295,000 dols. ; grading and filling, 450,000 dols. ; landscape, 323,490 dols. ; viaducts and bridges, 125,000 dols. ; piers, 70,000 dols. ; waterway improvements, 225,000 dols. ; water supply and sewerage, 600,000 dols. ; railways, 500,000 dols. ; steam plant, 800,000 dols. ; electricity, 1,500,000 dols. ; statuary on buildings, 100,000 dols. ; vases, lamps and posts, 50,000 dols. ; fuel and light during construction, 20,000 dols. ; heating, 8,000 dols. ; making a total of 12,066,890 dols.

There has been appropriated for the purposes of the World's Congress Auxiliary, 200,000 dols. ; landscape gardening, viaducts, fountains, &c., on the lake-front, 200,000 dols. ; general expense of construction department, 500,000 dols. ; making a grand total of 12,966,890 dols.

THE Chicago Exhibition Directors have appropriated 50,000 dols. for the expense of reproducing at the exhibition the Convent of La Ribada, Palos, Spain, where Columbus lived while perfecting his plans for his voyage of discovery. The building will be used for housing an extensive collection of Columbus relics, and its ancient appearance, it is believed, will afford a pleasing contrast to that of the magnificent palaces by which it will be surrounded.

PLANS have been completed for the Live Stock Assembly Hall at the exhibition. This building will stand just south of the colonnade connecting agricultural and machinery buildings. It will in form resemble the letter T, one portion being 500 feet long and the other 200 feet. On the first floor will be office room for cattle and horse associations, dog and pet stock associations, and all remaining live-stock organisations. On the second floor will be an assembly hall 172 feet long and 74 feet wide. Here the farmers will be given a chance to hold their assemblies. Special rooms are provided for the Farmers' Alliance, the National Grange, and other similar associations. The entire structure has been so planned as to give the farmers and live-stock men generally all they could ask in the way of accommodation. Chief of Construction Burnham has been instructed by the Committee on Grounds and Buildings to perfect working drawings and ask for contracts.

MEXICO, Guatemala, Salvador, Nicaragua, Costa Rica, Colombia, Ecuador, Peru, Chili and Brazil, will erect special buildings. Mexico will produce at Jackson Park one of the ancient Aztec temples. Guatemala will erect at a cost of 22,000 dols. a building on the model of one of the palaces of the ruined city

Antigua. The building of Colombia will be the capitol of that republic in miniature. Ecuador has already given orders for the removal to Chicago of the reproduction of the Incas's "Temple of the Sun" that ornamented the grounds of the Paris Exposition.

THE Board of Lady Managers have received 107 designs for an official seal for the Board, none of which were conspicuously devoid of talent, and some of which possessed distinguished merit. Seven designs were selected from the entire collection, and, in compliance with the published terms of the competition, these were forwarded to St. Gaudens, the celebrated artist, who is to make the final selection from the seven. The Board, having decided to have a badge also, a circular requesting competitive designs will shortly be issued. The most important art competition yet invited from women is for the statuary upon the exterior of the Woman's Building. Circulars stating details have already been sent out. There are to be eight figures above the roof-line, and a relief composition in the main pediments. The space to be filled by the latter is 42 feet long and 7 feet high, affording ample scope for a beautiful symbolic design. Miss Enid Yandall, of Louisville, Kentucky, is engaged in modelling the caryatides supporting the cornice of the roof-garden of the Woman's Building.

LADY ABERDEEN is now in America, and will visit Chicago during the autumn.

VARIETIES.

THE Gaiety Theatre, Camden Street, Liverpool, a building which has been used for variety entertainments, has been burnt down.

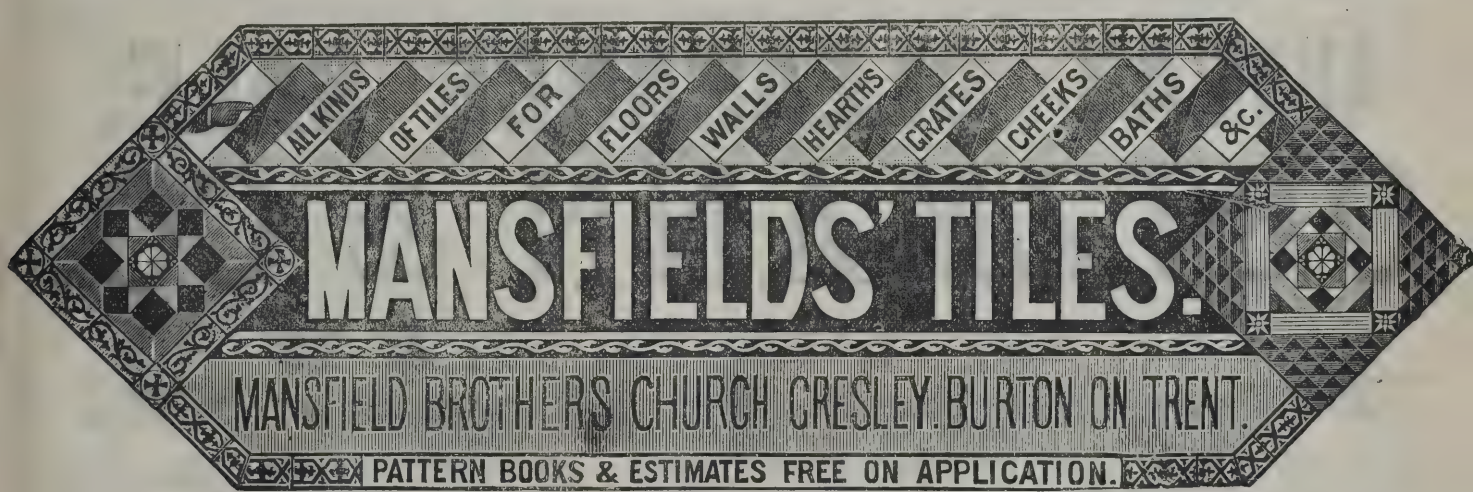
PLANS have been prepared for building a bridge at an estimated cost of 800*l.*, to replace the ford over the Black Lyne at Blackpoolgate, Bewcastle.

THE *Gloucester Chronicle* says in the grounds of Whiteshill Vicarage have been found fragments of Roman pottery, calcined bones, and large-headed nails, characteristic of the vicinity of a Roman villa. Like the Woodchester pavement, the first finds were but 2 feet below the surface, when a stratum of soft brick and cement, mixed with charcoal, was reached. The two former substances, laid to a regular thickness of about 6 inches, always constituted the *suspensuræ*, or floor above the hypocaust, in Roman villas. The coins which have been found are in excellent preservation. One of the Tribune era, which has the traditional wolf on the reverse, and which dates about 400 years B.C., was easily deciphered, and others were of Constantine and Severus.

THE general committee of the Hospital Saturday movement in Birmingham have sanctioned the purchase of a mansion at Tyn-y-coed, Llandudno, at a sum not exceeding 7,500*l.*, for the purposes of a convalescent home.

ONE of the ornamental lions at the entrance to the Bargate, Southampton, placed there one hundred and fifty years ago, has fallen from its pedestal. Fortunately it fell at a very early hour, before the traffic had commenced.

A BRIDGE has collapsed on the North British Railway, on the Waverley route, about two miles north of Galashiels. It is a single iron girder bridge, resting on an abutment at each side. The flood undermined the abutment on the south side, and half of the bridge fell in, leaving the down line rails suspended.



AN inquiry has been held at Southend respecting the application of the Southend Local Board to borrow 8,871*l.* 2*s.* 6*d.* for works of main drainage, for cliff improvements, and for the purchase of a pleasure ground. The main item of the loan is for the Eastern Valley main drainage. The sewerage scheme is divided into the outfall sewer, the main sewer and three branch sewers. The amount asked for is 7,240*l.*; 1,200*l.* was required for the Cliff improvements and 431*l.* 2*s.* 6*d.* for the purchase of Darlow's Green.

AT the meeting of the Canterbury Museum and School of Art Committee, the Mayor stated he had received a telegram from Dr. Beaney's executors, saying that the whole of the 10,000*l.* must be expended in the building and furnishing of a Beaney Hall, and none could go towards endowing it. He was of opinion that they could close the Museum Library, and make one big library; they could then endow it with about 300*l.* a year.

THE plans and specifications of a water scheme for Malvern have been prepared by Mr. Copland, C.E.

BY reason of increase of population and visitors at Clacton-on-Sea, the accommodation in St. Paul's Church has become insufficient, and more accommodation will have to be provided.

ON the invitation of Mr. Ben Sykes (of the firm of Messrs. Garlick & Sykes, architects, Blackpool and Preston), the directors of the Winter Gardens Company, some members of the Corporation and the town clerk (Mr. T. Loftos) have made a trip up the Ribble for the purpose of viewing the great navigation scheme and the docks which are now in course of construction at Preston under the direction of Messrs. Garlick &

FLUATE

Apply to the Bath Stone Firms, Ld., Bath.

Sykes. The visitors were surprised to find the undertaking of such a gigantic nature, and to hear that it would be ready for opening early next year.

APPLICATIONS have been made in the Carlisle Consistory Court for removing old glass and substituting stained-glass windows in Rydal Church and Aspatria Church. The Chancellor, in granting both applications, said he would like to inform the diocese generally that one of the first questions he was asked when he was appointed Chancellor was whether it was necessary to take out a faculty for putting in stained-glass windows, and he was obliged to answer that it was the law that it should be done. In one church not long ago a large stained window was put in without any faculty having been obtained. Any one putting in a stained-glass window was liable to be cited before the Court at the instance of a parishioner, and made to pay for a faculty or take out the window; and it was an infraction of the rights of the parishioners to put in a window without giving them an opportunity of coming to the Court to say whether they objected or not.

NEW special seats have been placed in the Birmingham Town Hall for the coming Festival. They have been provided by Mr. A. R. Dean, for a committee of friends of the Festival, and have been made to take to pieces for easy storage. The number of chairs is 1,468, and the estimated cost of the process of reseating is 1,300*l.*

BUILDING AND BUILDERS.

A SITE has been purchased at Castleton for the erection of Wesleyan Methodist schools. It is proposed also to build a chapel later on.

IT is proposed to build a new college at Blairs at a cost of 25,000*l.* A site has been selected, but no plans have as yet been prepared.

A PUBLIC company has been registered in Edinburgh under the title of the Albert Hall Company, Limited, "to acquire, erect, or maintain buildings in Aberdeen to be used for the holding of public or other meetings, concerts, lectures, and letting for various purposes."

THE Bridgnorth Board of Guardians have decided to submit to the Local Government Board sketch plans of alterations to their infirmary, which include the building of two new wings in the place of building a new hospital on modern principles, as suggested by the architect to the Local Government Board.

IT is stated that a Masonic Temple is to be erected in Glasgow, the cost of the scheme being estimated at 20,000*l.* It has been decided that at least two-thirds of the money must be subscribed before any building operations are undertaken.

AT the meeting of the Stone Local Board plans of the proposed Station Hotel were passed, subject to proper tracings being deposited and to the building being constructed in accordance with the by-laws, and drainage constructed to the satisfaction of the Board.

CONTRACTS have, the *Scotsman* says, just been concluded for the erection of a new station at Bathgate Lower Station. The new station will be a handsome building, and the platform will extend to about 120 yards.

THE *Birmingham Post* says:—We understand that the promoters of the pig market, proposed in opposition to that to be erected by the Markets and Fairs Committee of the Birmingham Corporation, have concluded negotiations for the purchase of land, in the neighbourhood of Meriden Street and Bordesley Street, from Sir Alfred Gooch, Bart., and will shortly commence to demolish the property existing on the land prior to beginning the new structure.

A DINNER has been given by Mr. J. F. Lescher, of Brentwood, to the men employed by Mr. John Cross, builder, Mr. G. Yull, plumber, and Messrs. Faulkner & Sons, who have been engaged upon extensive alterations at Boyles Court, the seat of Mr. Lescher. The work is now practically completed.

CONTRACTS have been entered into for banking premises in North Parade and Manor Row, Bradford, for the Yorkshire Penny Bank. Mr. Jas. Ledingham, of Bradford, is the architect.

THE committee of the Aston Technical School have decided to buy a site and erect on it a technical school. A sub-committee has been appointed to arrange for plans and other details. The cost for site and building is estimated at about 6,000*l.*

THE Plans Committee of the Aberdeen Town Council have passed the plans for Mann's Hotel, in Union Terrace, the architects being Messrs. Matthews & Mackenzie. The estimated cost is 10,000*l.* Plans were also sanctioned for a chapel for the sisters of St. Margaret's of Scotland, to be erected on the west side of Spittal. Messrs. Bricknell & Cowper, London, are the architects, and the estimated cost is 2,000*l.*

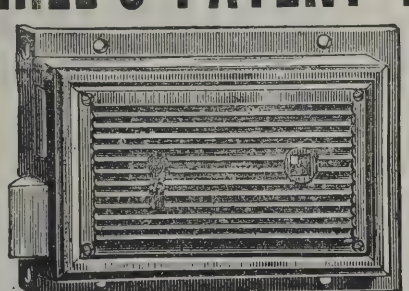
CLIMAX VENTILATING CO., 15 GREAT GEORGE STREET, WESTMINSTER, S.W.

Over 1,000*l.* has been subscribed towards the 2,000*l.* required for the building fund for the enlargement of the accommodation for nurses at the Cumberland Infirmary, Carlisle.

Among the warrants granted by the Edinburgh Dean of Guild Court was one to Messrs. M'Vitie & Price for additions to their biscuit works at Gorgie Road.

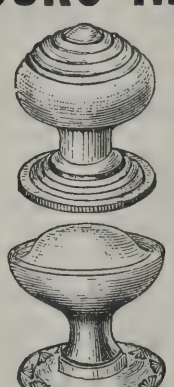
The George Inn, West Street, Brighton, is to be rebuilt as a hotel at a cost, including adjoining property, of 21,000*l.* The architects are Messrs. Treacher & Fisher, of Coleman Street, E.C.

In the Wakefield county court, before Judge Greenhow, Henry Dickinson, a bricklayer, sued Mr. John Bagnall, builder and contractor, Eastmoor, for 70*l.* damages. On June 8 the plaintiff was working in defendant's employment repairing a maltkiln in Thornes Lane, belonging to or worked by Messrs. Sanderson & Sons. Plaintiff fell from a scaffold, in consequence, as alleged, of a scaffold-pole being defective, and defective to the knowledge of the defendant and his son William, a foreman of the defendant's. In defence, it was said that the plaintiff selected the scaffolding-poles, and that William Bagnall was only the timekeeper. The judge gave the plaintiff a verdict for 80*l.* and costs—40*l.* for wages and 40*l.* for pain and injury, he having fallen from the scaffold, which gave way, and sustained serious injury.

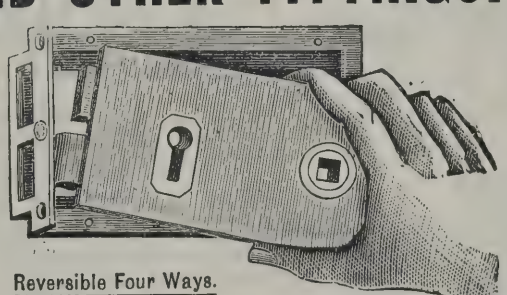


ENGLISH *v.* METRIC MEASUREMENTS.

Recent consular reports from Italy and Japan have referred to the loss of trade owing to firms in England sending to those countries circulars and price-lists based on the English weights and measures. The metric system is used in those countries, and our French, German and other competitors use it in their quotations, but the English firms in question are content to puzzle buyers with weights and measures which are very troublesome and not understood. A similar complaint now reaches us from Egypt in a consular report just issued, which points out that our weights and measures are "utterly unintelligible" to a large proportion of the persons to whom export houses in this country forward their circulars and price-lists in Alexandria and Cairo. The metric system of weights and measures is in force in Egypt, and exporters of English goods to that country should adopt it in their quotations and transactions.



EIFFEL TOWER, BLACKPOOL.



The foundation-stone of the Eiffel Tower for Blackpool has been laid. The syndicate formed to carry out the project entrusted the work to Messrs. Maxwell & Tuke, architects, Manchester. The buildings, the *Leeds Mercury* says, will occupy a site containing about 6,000 square yards in the centre of the town, lying midway between the two piers, and bounded on three sides by the Central Beach, Bank Hey Street and Victoria Street, and on the fourth side by a narrow street called Heywood Street, connecting the Central Beach with Bank Hey Street. Although the tower will occupy the central portion of the site, it will in reality absorb but a small proportion of the whole area. The space it actually covers is only one-fifth of the site, and even this portion is utilised on the ground floor as a circus. The design shows the tower surrounded on the ground and two upper floors by an enclosure of brickwork, 110 feet square and 73 feet high, and the whole of the space on the first and second floors is given to the circus, accommodating about 2,000 persons, with four entrances from the Central Beach and four in Bank Hey Street. On each side of the circus will be a large market or toy arcade, extending from Bank Hey Street to the Central Beach. These will be 61 feet wide, and will average 165 feet in length. They will be thoroughly well lighted from the two ends, and from four large areas which will distribute lights from the top. The present Aquarium and its complement of animals and fish will be reinstated at the south side of the circus, in a room 61 feet by 175 feet, extending from Bank Hey Street to the Beach, with windows on three sides, and with two areas for light, each 30 feet by 24 feet, in the centre. In addition to this room the Aquarium will occupy a space on the east side of the circus, 115 feet by 19 feet. The space over the northern arcade will be devoted to exhibitive and recreative purposes, amongst which it is intended to instal a rifle shooting gallery, with scenery accessories, similar to that which has proved so attractive in the Naval Exhibition. The north end of the first floor, 144 feet by 24 feet, over the shops facing Victoria Street, will be equipped as a first-class restaurant. The second floor of the building will be almost wholly occupied as a promenade concert-room, 223 feet long and 110 feet wide, and by large open balconies facing the sea, and in Bank Hey Street by a billiard-room at the north end to accommodate nine tables. The numerous open balconies, containing on the whole 17,000 square feet, will be a great feature in the design, and it is expected that refreshments will be served

HILL'S PATENT LOCKS AND OTHER FITTINGS.

JAMES HILL, 100A QUEEN VICTORIA ST., LONDON, E.C.

here, and that during the season they will be beautifully decorated with evergreens and flowering shrubs. The third floor of the building will occupy only the space over the circus exclusive, which is 110 feet square. It will consist of open balconies, 18 feet wide, on four sides, and of an enclosed hall, 70 feet by 44 feet, where the elevators from the ground-floor terminate, and where those going to the top of the tower commence. The two sides of this hall will be enclosed by cafés and by shops for the sale of souvenirs and other trifles. The principal entrance to the tower and to the various rooms already described will be on the central beach, and will consist of a hall 48 feet by 34 feet, from which lead two 9 feet staircases to the first and second floors, and two subsidiary staircases 5 feet wide to the first, second and third floors, and two elevators, each with a cabin 12 feet by 6 feet, which will convey visitors to the first, second and third floors and to the tower. In addition to this there will be two entrances in Bank Hey Street, each with a 5-feet staircase leading to the first, second and third floors. The means of exit have naturally received careful consideration, and they are ample enough to allow of the entire clearance of the building in a very few minutes.

EDINBURGH CITY CONTRACTS.

LAST week a report appeared of the discussion in the Edinburgh Council Chamber. Messrs. William Gray & Son, who are most aggrieved, offer the following remarks on what was said:—Because Bailie Russell can find no satisfactory answer to the complaint which we have made regarding our contract with the town, he demeans himself by abusing us and our workmanship in an underhand manner. In his speech to the Town Council on Tuesday he stated as his main reason for not fulfilling that contract that "the committee had to go to people who they were sure would act promptly and successfully," and he also hinted that our workmanship was bad; but we would ask Bailie Russell, instead of making general charges against us, to point his finger to one instance where we did not act "promptly and successfully," or where our work was not first-class. This would be more manly on Bailie Russell's part, but as it is impossible for him to do so he contents himself with attempting to blind the public by making a sweeping charge. Does Bailie Russell not see, when he makes such a charge against us, that it is convicting his own Council of muddle-headedness; for why would the Town Council ever think of entering into a contract with a firm who they were not sure would act "promptly and successfully?" We would assure Bailie Russell, however, that we have executed many important contracts—much more important than the one in question—and it is quite a novelty to us to hear that the quality of our workmanship is challenged. We do not wish to say more on this subject, as we are satisfied that it was necessary for Bailie Russell to say something in his defence, and as he had nothing better to say, he fell into abuse.

In Mr. Morham's report, read by Bailie Russell, he attempts to make out that our contract was for locks and hinges only, but permit us to say that our contract, which is now before us, is for "smith and ironmongery work," and it seems proper that all work under these denominations should have been executed by us at schedule rates. We had also a contract with the town for locks and hinges, as stated in the report, but this is a separate contract altogether. But Mr. Morham's report also defends the position of the Town Council on the ground that there is a clause in the contract reserving to the magistrates and Council power to enter into any separate contract they may consider desirable, and this may be a very wise provision if properly applied. But it surely cannot apply to the present case, where we got work to do under our contract to the amount of 23*l.*, while ex-Bailie Walcot, during a shorter period, ran up an account against the town amounting to 41*l.* We asked in our former letter that Bailie Russell should state the rates which were paid to these outside tradesmen; but he apparently declines to do so, and the reason of his refusal is perfectly obvious. It is this:—That the committee paid very much higher rates to ex-Bailie Walcot than we had contracted to do the same work for. For instance, ex-Bailie Walcot charges 1*s.* per hour, on an average, for a workman, and the town only pays 7*d.* per hour, less discount, to the contractor. Is this throwing away the ratepayers' money, or is it not? There is a standing order in the Town Council to the effect that all work above 20*l.* in value is to be publicly estimated for. Will Bailie Russell produce the estimate given by ex-Bailie Walcot for the work executed by him? We are afraid he cannot, as none exists.

When we found a man being frequently employed at the City Hospital and elsewhere executing the work which should have been performed by us, we went to Mr. Morham, the superintendent of works, to inquire the reason of the work being given to another tradesman, and he informed us that he was not aware that any work was being done in the hospital beyond

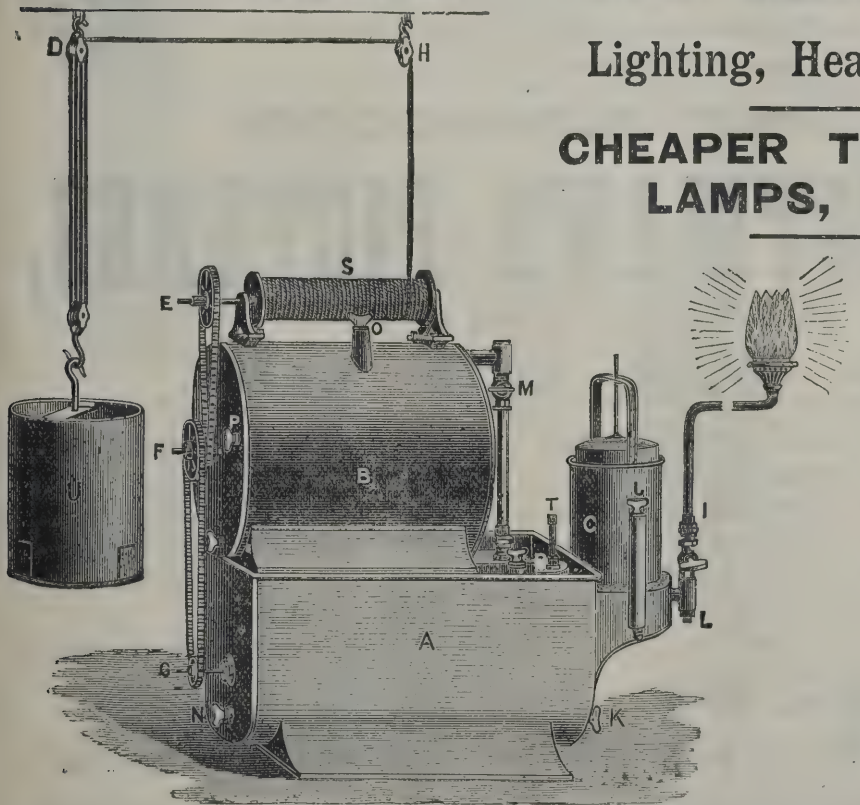
our own, and said that the work must have been ordered on the instructions of some other person. He also said that the doctor—not the would-be Provost doctor, but the doctor of the hospital—had taken upon himself to order certain repairs to be executed at the hands of other tradesmen, and that the doctor certified the accounts himself. Mr. Morham further confessed that one of the Parks Committee had asked him to give the tree fences and the repairs on the fences, which fell under our contract, to another tradesman, but asked us to write him on the subject ourselves and he would submit it to the committee. We thought, however, that matters had come to such a crisis that it was time to go to headquarters, and we accordingly wrote the town clerk. Now it is well known that the ratepayers have to provide Mr. Morham with a salary of 700*l.* a year, and part of his duties is to give orders for the execution of necessary works on the instructions of the various committees. Bailie Russell, however, appears to think that Mr. Morham is already over-wrought, and relieves him of part of his duties by ordering the work direct himself. If this be not correct, we beg to ask Bailie Russell to state if the orders given to ex-Bailie Walcot for work executed by him run consecutively through the superintendent's books. The orders may have got to the books by this time, but they were not there at the time the work was ordered, as they ought to have been.

Ours is only one case which has been brought to light, but, unfortunately, the system of dealing which we have exposed is far too common among our municipal rulers, and the sooner this mode of doing business is put an end to the better for the ratepayers. The latter have it in their own hands in the month of November, and it will be very strange indeed if they do not take care that more worthy men are sent to represent them at the Council Board.

REGISTRATION OF PLUMBERS.

At the 17th Annual Congress of the Sanitary Association of Scotland, held in the Council Chamber, Edinburgh, under the presidency of Dr. Robert Farquharson, M.P., Mr. Alexander M. Scott, writer, Glasgow, read a paper on the national registration of plumbers in its relation to the public health. He recalled the circumstances attending the inauguration of the movement for the national registration of plumbers, and explained that the district councils of the body had nothing whatever to do with any trade organisation, but existed solely for the benefit of the public. Since the movement had been set on foot a considerable number of technical classes in plumbers' work had been established over the country, and the attendance at these had been large. While such good was being derived from the registration movement, it was, of course, in the future that its full benefit from the point of view of public health would be felt, when the rising generation of plumbers all over the country should have a technical as well as a practical training. Hitherto no Parliamentary powers had been asked in connection with the movement, but now that registration was general, the time was ripe for introducing a Bill into Parliament in order to obtain the necessary disciplinary powers for the satisfactory carrying out of the system. It was desired by the trade that a Parliamentary measure such as this should be passed. The proposed Bill was drafted, and had the approval of the recent Congress of Scottish district councils in connection with the registration movement. It was not intended that the Bill should act compulsorily on the trade; the object was to obtain powers for the formation of a Council of competent jurisdiction and authority to take measures for systematically promoting technical education among all plumbers in the United Kingdom, and for regulating the classes of those plumbers who were enrolled as registered plumbers. The registration movement and the proposed Bill were in the interests of public health of the community.

The President said that legislation in the direction referred to by Mr. Scott was sometimes rather difficult, but from his experience of the House of Commons, he thought that the Bill which had received the preliminary sanction and support of the authorities would go through the House without any difficulty whatever. It was proper, also, that penal powers should be conferred upon the company to enable prosecutions to be instituted against all persons who, without registration, took a title which would induce the public to think that they were registered.



Dr. Caldwell Smith, Motherwell, moved:—"That the Congress, in the interest of public health, approves of the national registration of plumbers, and remits to the Parliamentary Bills Committee of the Association to consider and, if thought desirable, to petition in favour of any Bill that may be submitted to Parliament for furthering the objects of the movement."

The resolution was supported by Dr. E. Duncan of Glasgow, Mr. Kenneth Cameron, of Aberdeen, and others, and, after a lengthened discussion, carried unanimously.

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

METROPOLITAN WORKS.

ON the recommendation of the Finance Committee of the London County Council, it has been agreed to lend the Vestry of Lambeth 20,000*l.* for Jarrah wood paving works in the Kennington Park Road and Brixton Road, repayable as to 6,000*l.* in ten years, and 14,000*l.* in seven years; the St. Saviour's District Board 1,600*l.*, for wood-paving in Borough High Street, repayable in three years; the Vestry of St. Margaret and St. John, Westminster, 10,300*l.*, for asphalte and new wood-paving works, repayable at periods varying from five to ten years; the Guardians of Fulham 26,000*l.*, to defray the cost of the enlargement of their workhouse, repayable as to 21,000*l.* in thirty years and 5,000*l.* in fifteen years; the Guardians of St. George's-in-the-East 6,200*l.*, to purchase a freehold site and erect a laundry, 5,000*l.* being repaid in thirty years and 1,200*l.* in fifteen years; and the Commissioners of Baths for St. Margaret and St. John, Westminster, 7,000*l.* to purchase a freehold site and erect a library, repayable in thirty years.

RICHMOND MAIN DRAINAGE WORKS.

ON Monday the new works constructed at Mortlake by the Richmond Main Sewerage Board for the collection and disposal of the sewage of the parishes of Richmond, Barnes, Mortlake, Kew and Petersham were opened by Mr. Ritchie, M.P. The sewage of the above parishes has hitherto been partly discharged in its crude state direct into the river Thames, and partly retained in cesspools. Both of these evils will be remedied by the present works, which have been constructed in accordance with the plans and under the direction of Mr. J. C. Melliss, C.E. The works were begun in August 1888, and, many unforeseen difficulties and delays occurring, three years have been occupied in their construction. They provide each of the parishes of Barnes, Kew and Petersham with an outlet into which it can discharge its sewage matter, the outlets being placed at a sufficiently low level to drain the whole district. In like manner Richmond and Mortlake have been provided with several such outlets for the reception of their sewage, and for diverting its flow from the Thames. These outlets for the five parishes are connected together by main intercepting sewers, which have been constructed by the Main Sewerage Board. The sewage arrives at the works in a fresh state before any decomposition has had time to take place. It is strained through an iron bar strainer before entering the pump chamber, cabbage stalks, rags and similar articles being thus removed and daily disposed of by being dug into the gardens. In quantity this will be about 1 cwt. per day. The strained sewage then flows continuously into the pump chamber, where it receives a small dose of milk of lime from the vats in one of the chemical mixing-rooms. It is then pumped to the

surface, the operation of pumping also serving to thoroughly mix the sewage and the milk of lime together. The partially-treated sewage then flows from the delivery pipes of the pumps by a covered channel along the side of the pump-house. It then flows continuously to the inlet channel for treated sewage, passing in its course through a close iron bar strainer which removes any large matter that may have passed the first strainer; also through the second chemical mixing-room, where it receives a dose of a solution of sulphate of alumina, carbon and iron, and is thoroughly mixed therewith by an agitator placed in one corner of the chemical-room. The treated sewage is admitted continuously into one or more of the precipitation tanks, as required, by the opening of valves, and flows continuously over weirs extending the entire width of the tanks. As the tanks fill, precipitation takes place, the precipitate rapidly falling to the bottom of the tanks, while the effluent water, now deprived of the whole of its polluting matter in suspension and nearly all of that in solution, flows continuously over weirs at the other end of the tanks. This effluent water is sufficiently pure to be discharged direct into the river, and is passed thereto, by the outlet provided, at the north-east corner of the works. The effluent water can be raised to a higher degree of purity, whenever required, by filtration through filter-beds constructed of layers of various-sized gravel, sand and carbon; the surfaces being covered with a thin layer of agricultural earth sown with grass. The precipitation tanks are emptied of their entire contents once a day, and when a tank has to be emptied it is shut off from the inlet-treated sewage channel by valves, and allowed a short time for repose; the water is then drawn off from the tank by a floating valve, the upper portion of the water, owing to the levels, being discharged on to the high-level filter-beds, and the lower portion on to the low-level filter-beds. The precipitate (commonly termed "sludge") at the bottom of each tank averages from 2 to 3 inches deep, being about 90 per cent. water. The water drawn off from the tanks and passed away to the filters or the river direct, is not, however, lowered quite down to the precipitate, the water immediately overlying the sludge for a depth of 6 or 7 inches being retained with the sludge. The bottoms of the tanks slope so as to form a channel, and the sludge and water last mentioned together gravitate, with the aid of sweeping, from the tanks into a covered sludge passage passing along their upper ends, and thence into the sludge-chamber beneath the presshouse. In this sludge-chamber precipitation still rapidly takes place, and the water which rises to the top of the sludge is drawn off, but not allowed to pass to the filter-beds or the river, but flows back again into the pump-chamber, mixes with the sewage, and is therewith treated over again. The quantity of water thus dealt with is comparatively very small. The sludge, having thus been deprived of some of its water in the sludge-chamber, and brought into a favourable condition for pressing, is lifted by pumps into iron receivers placed in the presshouse. These receivers each contain a charge for one press. In these it is limed—that is, a small quantity of lime is added to it so as to facilitate the operation of pressing—and it is forced by rams into the presses. The water pressed out of it (again a comparatively small quantity) passes to the pump-chamber and mixes with the sewage to be treated over again, and the solid "sludge-cakes," measuring 3 feet square by 1½ inches in thickness, are removed from the presses. Sludge in this pressed condition occasions no nuisance whatever, and may be stacked and stored without creating even an annoyance. For agricultural purposes it is stated to have a manurial value rather higher than that of the best farmyard manure. The quantity that will be produced from the present population will be about 10 tons daily, and, considering the great demand for manure of all kinds by the market gardens surrounding the locality, it is believed that there will be no difficulty in disposing of it. Pressed sewage "sludge-cake," which contains about 50 per cent. of water and readily parts with such water, is very suitable for making up and raising low-lying land, and the Board will be able to utilise much of it for this purpose of raising to a higher level, and thus materially improving, their own land. The entire cost of the works, including the sewers, will amount to between 115,000*l.* and 120,000*l.* The exact outlay has not yet been, and cannot at present be ascertained. The annual expense of carrying on the works, including pumping the sewage, is estimated at 3,500*l.*, and this, together with the repayment of capital and interest, will not, it is expected, exceed a rate of 7½*d.* in the pound for the entire cost. The charge is borne in due proportions by the urban and rural parishes, according to their respective rateable values from year to year. Both the Richmond urban and rural sanitary authorities have expended, and are still expending, large amounts (independently of the Main Sewerage Board) in extending and improving their local drainage, and adapting it to, and connecting it with, the main sewers of the Board. When these works are completed, as they shortly will be, the entire districts of the two authorities will be supplied with a complete and effective system of drainage, purification works and outfall.

BAIRD, THOMPSON & CO.'S
LATEST IMPROVED
PATENT EXHAUST ROOF VENTILATOR.

No. 3.

AWARDED
The Grand Diploma of Honour and Gold Medal, Brussels.

Has been proved the most powerful and perfect Exhaust Ventilator, as well as the cheapest in the market. Continuous in action, entirely free from down-draught, and thoroughly waterproof.

SHORTLANDS AND NUNHEAD RAILWAY.

This line, now in course of construction, commences by a junction with the London, Chatham and Dover Railway Company's main line at Shortlands Station and terminates by a junction with their Greenwich branch at Nunhead Junction. The object of the line is to develop some of the estates through which it passes, and which will become valuable residential properties, the owners of these estates being among the chief promoters of the railway. It will also give the London, Chatham and Dover Railway Company, who are under an agreement to work the line, an alternative route for their main line traffic into the metropolis *viâ* Nunhead Junction and the South London line.

For a suburban railway the country passed through is very open, the only building property actually taken being at Catford, yet the number of bridges is considerable, averaging about five per mile. This is mainly due to the number of bridges erected for the accommodation of the landowners in laying out their estates. All the bridges will be of an ornamental character, and the slopes of the cuttings and embankments from Shortlands through Catford will be planted with shrubs and trees.

Amongst the works are included three bridges over existing railways, two short brick viaducts and a retaining-wall in Catford, besides other public road and accommodation bridges. The bridge over the South-Eastern Railway, near Catford, will consist of two N truss girders with a skew span of 113 feet each, with underhung cross girders and rail bearers. That over the London, Brighton and South Coast Railway at Brockley will consist of three girders 110 feet span each, of a type similar to those just mentioned, the centre one being between the two lines of rails. The floor in this case will consist, as the headway is limited, of troughs built up with angle-bars and plates.

In the case of bridges carrying roads over the railway, the superstructure consists of girders and jack arches, except in three cases where headway is limited and longitudinal-built trough flooring has been used, supported by a transverse girder on columns in the 6-foot way. In the case of road bridges under the railway trough flooring will also be extensively used on account of the limited headway in most cases. This construction also enables the floor to be made perfectly watertight, and the transverse sleepers lying in the troughs being surrounded with ballast, the sound of passing trains will be deadened as much as possible. These bridges have all a clear span of 40 feet at least, and in some instances where the span is greater columns standing on the curbs of the footways are being introduced to lessen the weight of the girders and to improve the appearance of the structures. Steel is being used for the bridgework throughout, the columns in the roadways and ornamental work being of cast-iron.

There are to be five stations on the length, not including those already existing at Shortlands and Nunhead. It is expected that the line, which was commenced in July 1890, will be ready early in the ensuing year.

The work is being carried out under the superintendence of Mr. John Wolfe Barry, the company's engineer, and Messrs. Lucas & Aird are the contractors.

THE IRON AND STEEL INSTITUTE.

The autumn meeting of the Iron and Steel Institute will be held in London on October 6 and 7, this being the third time that London has been selected for the place of this meeting. The programme, which has just been issued to the members of the Institute, intimates that the first day's meeting will take place at the Royal Arsenal, Woolwich, when two papers will be submitted, the first by the Director-General of Ordnance Factories, Dr. W. Anderson, F.R.S., "On the Constitution of the Royal Ordnance Factories"; and the second by Captain Holden, R.A., proof officer, Woolwich, "On the Measuring Instruments used in the Proof of Guns and Ammunition at the Royal Arsenal." After the morning meeting, the members will be conducted over the manufacturing departments of the Arsenal, and will be entertained at luncheon by the president of the Institute, Sir Frederick Abel, K.C.B. After lunch, other departments of the Arsenal will be visited, and the members will then assemble at the Proof Butts to witness the firing of quick-firing and machine guns, experiments with smokeless powder, &c. On the following day the Institute will resume its sittings at the Institution of Civil Engineers in Westminster, when a number of papers will be read, including one by Sir Henry Bessemer, F.R.S., "On the Manufacture of Continuous Sheets of Malleable Iron and Steel, direct from Fluid Metal," and another by the Director of Naval Construction, Mr. W. H. White, C.B., "On Illustrations of Progress in Material for Shipbuilding and Engineering in the Royal Naval Exhibition." Several places of interest will be open for the inspection of

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important Inventions of the Nineteenth Century.

PATENTED IN England, Belgium, France, Germany, Italy.

REGISTERED

TRADE MARK.

PATENTED IN Austria-Hungary, Denmark, United States of America.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement, stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

TESTIMONIALS.

21 New Bridge Street, London, E.C.: February 23, 1886.
I have had some trials made with the KALLKOLITH during the past few weeks, the results of which are very satisfactory. The KALLKOLITH is to be used as the first coat of paint on wood and other substances, and is of such a nature that the ordinary work in preparing for paint is considerably lessened, and the usual number of given coats now reduced, and, once fairly introduced in the market, I am certain there will be a large sale. J. WM. STEVENS, Architect and Surveyor.

75 Newman Street, Oxford Street, W.: Feb. 15, 1887.
We are pleased to tell you that the KALLKOLITH supplied to us has been fairly tried, and we find that it answers all that you claim for it.
CAMPBELL, SMITH & CO.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special terms to Wholesale Buyers and Shippers.

Address—KALLKOLITH CO., 175 STRAND, LONDON, W.C.

members, including the Royal Small Arms Factory at Enfield, the Royal Dockyards at Chatham and Portsmouth, and the Thames Ironworks at Blackwall.

CONFLAGRATIONS IN CITIES.*

CITIES have always been an expression of civilisation, measured by the skill and enterprise of their builders. Every human resource, stimulated by sentiment for home, avarice for possessions, and desire to be equal to posterity, has contributed means for fashioning them with a view to the utmost permanence; yet their history has been a continuous record of conflagrations whose devastating lines form historical divisions, separating the old from the new, and making swaths which have often proved to be paths for new improvements, but achieved at oppressive costs which would never have been entered upon voluntarily by the owners of the property destroyed. Most of these fires have resulted in forcing reforms in regard to streets, buildings, laws and health. Blessings they may have been, but to those directly interested at the time, most completely disguised.

The accounts of early fires ascribe them to the visitation of an angry Jehovah or Jupiter, by the exercise of a supernatural power, and it is indeed without question that many of these instances of destruction were the result of natural causes, as earthquakes, volcanic eruptions and lightning. However, little is to be feared from the latter form of visitation by any possibly reprobate city of to-day, thanks to the inductive effect, as well as the direct diffusion of the lightning by the much-abused overhead wires, which serve as a guardian between the earth and the sky, robbing the thunderbolt of most of its former dangers. The Christian era is only midway back to the earliest account of the burning of a city contained in the Holy Writ (Gen. xix.), describing the rain of fire and brimstone on Sodom and Gomorrah. So terrible was this devastation that the once fertile sites of these cities are to this day a sterile waste.

It is evident from the record of laws fixing penalties for such crimes that human agency was well recognised as a criminal cause of fires among the ancients. Among the Egyptians arson was punishable with death, and the Mosaic law, enacting a similar penalty, was probably a repetition of the same. In China it is forty blows for an accidental fire, and one hundred blows for a malicious fire in one's own house, and for causing a fire in any other house, death. Notwithstanding these severe penalties and the absence of insurance policies, the cities of the Orient, largely built of bamboo covered with thatch, and having narrow lanes, though well fitted to withstand earthquakes, are continually subject to conflagrations. One who was a resident in China for many years has stated, as a matter of opinion, that he considered the average existence of dwellings in cities to be about five years. In Japan so-called fire-engines, consisting of square wooden pumps attached to tubs, are hung from verandah roofs. These devices are of insufficient capacity and generally out of repair, like much of the independent fire apparatus among Occidental nations, and the main reliance is upon mud or stone buildings in the yard at the rear of the houses. These serve as safes in which the household goods can be stored in face of threatened conflagration. Such buildings are called by the Japanese "kura," and by foreigners "go-downs," although the latter term is also applied to storehouses owned by Europeans. Oriental cities have been devastated by fire again and again. The courses of such conflagrations have been plotted on maps of Japanese cities by Dr. T. C. Mendenhall, superintendent of the United States Coast Survey, formerly of the University of Tokio, and later of the United States Weather Bureau, and it has been found that the general trend of these fires is coincident with the direction of the prevalent winds.

Historical Fires.—Among the great fires of history undoubtedly the burning of the Serapæum Library, at Alexandria, in the year 640, by the Caliph Omar I., is most widely mourned, as the destruction of 500,000 volumes cut off much of the record of human knowledge at that time. The general impression of the importance and significance of this fire is, no doubt, augmented in great measure by the barbaric answer of this Saracen conqueror, who replied to the protest against the burning with, "If the books are against the Koran, they are pernicious and must be destroyed. If they agree with the Koran, they are redundant and need not be preserved;" and it is not generally remembered that Julius Cæsar burned a large library of 700,000 volumes at Alexandria, known as the Brucian Library, B.C. 48, nearly 700 years before the burning of the Serapæum Library by Omar I.

At times of sack and pillage, Jerusalem has been burned

* A lecture delivered before the Franklin Institute, Philadelphia, by Mr. C. J. H. Woodbury, vice-president Boston Manufacturers' Mutual Fire Insurance Company.

time and again, the most noted instance being at the siege by the Romans under Titus, during the year 70, when a faction called the Sicarii set the city on fire in many places, and eventually 1,100,000 of the inhabitants perished by fire and the sword.

Constantinople has, like all Oriental cities, suffered severely from fires, a large part of such losses being undoubtedly due to the fatalism of the Mahomedans, who bow to their kismet. Said a Sultan, "If it be the will of Allah that my favourite city burn, it is the will of Allah." In Dillaway's quaint account of travels in the Levant in 1797, it is stated that the Sultan is summoned three times to a fire in Constantinople, and if the fire lasts an hour he is obliged to attend in person, and bring mules laden with piastres for the firemen. The proverbial liberty during fires exists on these occasions, for custom gives to the women the privilege of execrating the Sultan with impunity whenever he appears at a fire. But it is evident that this custom of receiving piastres and bestowing virulence has in nowise tended to diminish the fires any more than the system of giving a reward to the company first at a fire under the volunteer departments of the last generation effected such results.

Rome continues to be the eternal city in spite of numerous fires, whose reported number may be greater than that of any other historical city, merely because the records are more perfect. Many of these fires are of great interest at the present day, because the lessons which they taught were well learned, and gave rise to new and original methods in preventing the repetition of the same incidents. A great fire at Rome, 12 B.C., caused the Emperor Augustus to take measures for increasing the defence against fire, which had been hitherto in the hands of bodies of police, numbering twenty or thirty, stationed in various portions of the city, and reinforced at times of fire by companies of volunteers. He appointed new officers with the rank of magistrates, who were entitled to wear magisterial robes. Each was attended by two lictors, and provided with a fire organisation of six hundred slaves. It is probable that this was not entirely satisfactory in its operation, because six years later another fire caused him to undertake further reforms on a scale fully characteristic of him who "found the city built of brick, and left it with palaces of marble." He increased the fire department to a scale commensurate with the needs of the city. Seven thousand freemen were organised into seven battalions, and one battalion was quartered in every alternate ward of the city. These men made careful inspections of the kitchens, of the heating apparatus and of the water supply in the houses, and every fire was the subject of judicial examination. The cost of the organisation was maintained by a tax of 25 per cent. on the sale of slaves. It is undoubtedly true that this organisation, to which only a brief reference has been given, was of the greatest efficiency, for I can find no reference to any great fire in the city for seventy years, when it was set on fire by the Emperor Nero in the year 64. The account of this fire, given by Lanciani, as the result of the latest investigations, is so different from the generally accepted tale of the city being set on fire by the malice of Nero, "who played the fiddle while Rome burned," that the recent version may be of interest. Nero desired to make many changes in the streets of Rome by increasing their width and making many of them more direct, and also to introduce many improvements by reconstructing public buildings. His efforts in this direction were met by an opposition from property-owners, and were also embarrassed by the fact that the city abounded in temples, altars and shrines which were inviolate. The Emperor directed two architects, Severus and Celer, to prepare plans for a rearrangement of the streets in certain parts of the city, making them as near to straight lines and right angles as the hilly configuration would render feasible. Numerous public squares were laid out, and a system of sewers planned. Regulations for buildings were prepared, in which it was provided that the height of houses should not exceed double the width of the street, that each house should be completely cut off from the adjoining buildings, that each house should have a portico in front, and that wood ceilings should be excluded from the first storeys of buildings. Tents and booths were secretly prepared, and vessels were sent to various Mediterranean ports after grain with orders to rendezvous at the delta of the Tiber on a certain date. In accordance with this plan the city was fired in numerous places, and of the fourteen wards three were entirely destroyed and seven burned in great part. The crowds driven out of their homes found the booths in the outskirts of the city ready for them. The grain-laden vessels appeared in time, and the town-people were fed and housed during the rebuilding; the whole plan having been carried into effect without exposure, famine or loss of life, although the population numbered at the time 2,000,000. Improved hygienic conditions have been the usual result of conflagrations, because in the natural course of events those engaged in rebuilding have availed themselves of opportunities

to introduce improvements, and often the causes leading to certain local epidemics have been destroyed; but it is without parallel that a city should be burned from hygienic motives.

Two notable examples of contagions stopped by conflagrations are the burning of Moscow by the besieging Tartars in July 1570, when the plague was stopped; and secondly, the fire in London, September 2, 1666, which also stopped the plague, and it has been unknown there since. This London fire is properly called the Great Fire of modern history, because the reforms which were started in consequence of it are living issues in the municipal affairs of to-day. The fire was caused by an overheated baker's oven; and in the course of four days it swept over 463 acres, burning 13,200 houses, 89 churches and St. Paul's Cathedral, causing a damage estimated to be 10,716,000*l.*, say 53,500,000 dols. The number of contemporaneous books upon the subject of this fire is between 200 and 300, but the greater part of them, judging from the list of their titles, contains but little information. The wonderful diaries of Samuel Pepys and Sir John Evelyn contain about all that is known in regard to this fire. Pepys was a man of the world, among the official set as Secretary of the Admiralty, a keen observer, and perhaps a journalist born out of due time. Evelyn was one of the gentry, complacent, more than pious, and quite philosophical in the bent of his mind. The one was the most perfect foil for the other. Under the direction of Pepys the fire was stopped by blowing up buildings, which was, at the time, the only method of reducing a fire that had grown beyond the capacity of the small fire-engines. These were on large tubs, and threw a stream of water directly on to the fire, as hose was not invented until ten years later (1672) by Van der Heide.

Important results followed the action taken in consequence of the Great Fire. The building regulations enacted provided for the reconstruction of the city with wider streets and better water supply and sewers—thus fitting London for the position of great commercial supremacy which that city has since maintained. The principle of modern fire insurance was also put into practice shortly after the fire and as a consequence of it. At a far earlier date there had been a form of marine insurance, and also a method of mutually indemnifying against fire, water and robbers, by the guilds; but both of these were by a mutual compact, socialistic in its nature, and not comparable to underwriting in modern practice, with its general commercial applications.

All cities have gained much from the experience derived from conflagrations. The French building laws are said to have been improved in great measure from action taken as a result of a fire in Paris in 1716, although the "Code Napoleon" (1804) increased these rules and restrictions to an extent praiseworthy in its results.

The firing of cities has been used as a desperate means of defence, which injured friends and foes alike; one notable instance being the burning of Jerusalem by the Sicarii, to which reference has already been made. Another example of burning a city in self-defence is the burning of Moscow, September 1812. Napoleon, in his campaign against Russia, in revenge for his repulse as a suitor for the successor of the yet undivorced Josephine, entered Moscow, September 14, proposing to make winter quarters there. On that very day fires began to appear, and in less than a week the city was in ashes. The loss of life is said to have been 20,000 of the sick and wounded, with a direct loss to the French of 40,000. The invaders were thus driven back in that terrible retreat in the dead of winter.

The cities of America, on account of the larger amount of wood in their construction and the prevalence of irresponsible methods of building, have suffered severely from fires, and it is from these fires that conclusions are to be drawn for suggesting measures that will tend to diminish their recurrence. Some of the possible elements of hazard, like those due to electricity or to very high buildings, are too new for their exact weight to be formulated; and others, like the attempt of the Indians to burn New York in 1711, have ceased to exist, at least in the older portions of the country. But such hazards have always existed at the frontier in the westward growth of civilisation.

The first devastating fire in America was probably the one occurring at Boston, March 20, 1760, when 400 dwellings and stores were burned, causing a loss of 100,000*l.* Generous contributions were sent from other cities to the people of Boston; and in 1811, when a large portion of the city of Newburyport was burned, the citizens of Boston, with a liberality which they have never failed to tender to other cities that have suffered by fire, took the initiative in subscribing for the relief of the sufferers.

In the colony of Massachusetts Bay regulations in regard to construction of chimneys and thatched roofs were made as early as March 16, 1630, and various enactments were made at later dates. The ordinance at the town meeting at Boston, March 14, 1645, made provision that each householder should have ladders long enough to reach the ridge of his house, and

a pole "about 12 feet long, with a good large swab at the end of it," and various graded penalties were provided for those not conforming to the law.

It is difficult to obtain a record of early American conflagrations outside of local histories. New Orleans was burned in 1777, and every city seems to have had more or less of similar calamities. Philadelphia has been remarkably free from conflagrations in comparison with other large cities. This may be in part ascribed to the early introduction of water, giving that city for several years an advantage in the way of an abundant supply of water. In a greater measure it is due to the abundance of land, making it feasible to avoid the density of buildings which is common to most cities; and in chief measure it is probably due to the prevalent and wise custom of people owning their homes, a fashion which in many other respects tends to prosperity and good order. Reference has been made to numerous fires on account of their relation to the growth of various methods of protection; but in Philadelphia it appears that the excellent record is due to the initiative measures, beginning with the Act of the Provincial Legislature in 1696, directing that every householder should keep at his dwelling a bucket ready for use and a swab, 12 or 14 feet long, under penalty of twelve shillings for neglect, and forbidding the burning out of foul chimneys, penalty forty shillings, and the smoking of tobacco on the streets day or night, the fine for the latter being tenpence.

New York was visited by a severe conflagration in the southern part of the city on December 16, 1835, which extended over an area of forty acres, destroying 674 houses and causing a loss which has been estimated as high as 30,000,000 dols., on which there was only 8,000,000 dols. insurance, an amount which ruined several insurance companies. It has been held by some that the destruction of property by great fires has rendered them the cause of financial depressions, and in this connection it has been stated that this New York fire was the cause of the panic of 1836.

Philadelphia does not appear to have been visited by a great fire until July 9, 1850, when a fire along the Delaware river front at Vine Street extended over eighteen acres, causing a loss of life estimated as high as thirty-three, in addition to 120 wounded and a pecuniary loss of 1,500,000 dols. The memory of this fire is perpetuated in the slang of to-day. An explosion was caused by a coincidence in the contents of a warehouse which contained sugar in the upper storeys and saltpetre below. When the saltpetre came in contact with the sugar a violent explosion ensued, and for awhile spread the fire beyond all efforts to control it. This catastrophe and the controversies which followed it gave rise to the satirical question, "Will saltpetre explode?" and was followed by an ordinance forbidding its storage in quantity in the city or in vessels in the river. This Act was afterwards modified (April 14, 1851). A greater fire occurred August 4, 1869, when, by the burning of Patterson's warehouse at Lombard and Front Streets, 24,000 barrels of whisky were burned, gutted or stolen, causing a loss of about 2,000,000 dols. If other large fires have conduced to order and wiser laws, the direct result of this fire led to disorder, for the opportunity of drinking without stint or price proved too great a temptation for many and the temperance cause languished to an extent without precedent.

One of the first of the more recent conflagrations was the burning of Portland, Me., July 4, 1866. The fire was caused by a boy throwing a fire-cracker into a cooper's shop for the avowed purpose of scaring the workmen. In this respect the act was an unparalleled success, the damage being about 10,000,000 dols. The eloquent letter of John Adams, July 3, 1776, after the resolution preceding the Declaration of Independence had been passed, in which he said of the Fourth of July, "It ought to be solemnised with pomps, shows, games, sports, guns, bells, bonfires and illuminations from one end of the continent to the other, from this time forward for ever" ("Letters of John Adams to his Wife," p. 128), has many catastrophes to answer for.

The Chicago fire, October 9, 1871, was one of the largest in all history, devastating an area of 3½ square miles, and causing a loss of about 190,000,000 dols., on which insurance was paid to the amount of about 100,000,000 dols. Two hundred and fifty lives were reported lost in this fire. Thirteen months later, to a day, Boston was visited by a fire which extended over an area of 65 acres, burning the best mercantile buildings in the city and causing a damage of 75,000,000 dols., on which there was insurance to over 65,000,000 dols.

Inspection.—As in other instances, these casualties gave rise to many plans for better building laws and for the reorganisation of fire departments. In the course of such changes many acts of injustice have been perpetrated by those who did not grasp the whole force of the chain of circumstances causing these devastating fires, conditions too strong to be controlled by any one set of rules formulated at white heat after a conflagration. These cities had great fires, and will, in the nature of things, have other great fires. Conditions exist which, in the event of

fires starting in certain localities and of any error in promptly giving the fire alarm, cannot fail to produce disastrous results.

The causes of fire are as infinite as the varying conditions of the numberless possessions of mankind, and beyond that the forces of nature contribute in no small degree to the fire loss. Whether it be the over-heated baker's oven at London, the balky cow at Chicago, the neglected waste in the engine-room at Boston, all great fires result from neglected small ones.

Every method of construction, every process of manufacture, every material in commerce, as well as every type of fire apparatus and the orderly conduct of affairs, bears some relation to the fire hazard. The function of the underwriter is not merely to give to these elements their just weight, but yet more to rise from a consideration of physical conditions to the higher and ethical questions relating to the moral hazard as measured by the probity of owners, who are always possessed of every opportunity to effect the destruction of their property by fire. The facility with which insurance can be effected, and the readiness with which losses are paid, renders incendiarism the great undetected crime of the present day.

It requires no argument to prove that the most efficient means of diminishing the amount of loss by fire is to lessen the number of causes of fire; but the best method of carrying such measures into effect is a question upon which there are legitimate differences. Inspections by men employed by associations of underwriters have given the most satisfactory results, but it may justly be queried whether this is the proper source for such an espionage over the community. These inspectors are employed by associations composed of competitors in the insurance business, and they are without any legal authority to enforce obedience to suggestions which are admittedly for the weal of all. Their requests are, for the most part, complied with, but the results are a benefit to the community, and it would appear that this service should be performed by persons clothed with authority from a municipality, as a part of the protective system which now extends protection to person and property by means of the police, the water-supply, and the fire departments, leaving to the underwriters their legitimate work of insuring property at prices based upon the estimated hazard. If the risk of destruction by fire is reduced, it will be a benefit to the community, which will be gladly recognised by underwriters in the diminution of premiums based on the new condition of affairs.

The methods of fire patrol carried on by members of the fire departments in many cities do not comply with the offered suggestions. There should be a patrol by members of the fire department, who should systematically inspect every building, searching into every preventable cause of fire, with authority to cause the proper remedies to be carried into effect. The building laws refer almost solely to the new buildings erected within a few years, but a commission like this would be able to introduce inexpensive modifications into old buildings, which would greatly modify many dangerous conditions of hazard.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Cassell, Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

15528. Alfred Mountain Fowler, for "Improvements in or applicable to water-closets."

15533. John Dunn and Louis Fischer, for "Improved roller for window-blinds and similar purposes."

15638. Walter Whitfield Bostwick, for "Improvements in metal lathing."

15704. Robert McAlpine, for "Improvements in the construction of dividing or partition walls for dwelling-houses or other buildings."

15724. Arthur Lloyd Clay, for "Improvements in fastenings suitable for doors."

15772. Oliver Brindley and Edwin Verity, for "Improvements in locks and latches."

15803. Robert Dennant, for "An improved domestic oven."

15836. Duncan Cameron, for "A new or improved suspended combination flush-out water-closet basin and trap."

15867. Charles Ingrey, jun., for "Improvements in stair-rod fastenings."

15933. Arthur Martin, for "An improved device for raising and lowering venetian blinds."

BRITANNIA TIN AND COPPER WORKS.

TO ARCHITECTS AND BUILDERS.

Fountain Street, Bury, and Shiffnall Street, Bolton:
February 13, 1891.

Gentlemen,—We have pleasure in announcing that we have opened extensive Show Rooms at 117 QUEEN VICTORIA STREET, LONDON (opposite Civil Service Stores).

We have been very successful in Lighting and Ventilating Public Buildings in all parts of the Country.

We have a large stock of Sunlights, Turrets, Exhaust Roof Outlets, Tobin's Tubes, Air Grids, &c., &c. at our Show Rooms.

We feel confident that our **DESIGNS**, as well as our system of Lighting and Ventilating will commend themselves to all who are interested in having BRILLIANTLY LIGHTED and WELL-VENTILATED ROOMS.

A visit to our Show Rooms will be esteemed a favour. If inconvenient to call, send for one of our Illustrated Catalogues, inspect our Designs, and read our Testimonials.

Trusting to receive your favours, which shall have our prompt attention,

We remain, Gentlemen, yours obediently, **J. H. PICKUP & CO.**

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED.

House Cistern, fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866; November 1867; and May 1870. The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

STEEL CHIMNEYS.

STEEL chimneys are being erected in connection with some of the lofty buildings in Chicago. The Fair building has at present the tallest under construction. The chimney, when completed, will be 250 feet high, being considerably higher than any other in the city, the highest at the present time being the one at the Gottfried Brewing Company's plant at Archer and Stewart Avenues, which is 175 feet. The outside diameter is 9 feet 5 inches, while the steel varies in thickness from $\frac{5}{32}$ at the top to $\frac{3}{8}$ inch at the bottom. The lower 75 feet of the chimney is lined with fire-brick 8 inches deep, formed to fit the shell compactly all round. Above this it is lined with hollow tile. This lining is supported at intervals of 25 feet by angle-iron rivetted to the steel shell; in other words, the chimney is lined in a manner similar to blast furnaces and foundry cupolas, and no expansion by heat can lessen its strength. The joints are all hot rivetted. The steel shell is carefully protected from corrosion and from any attacks by the weather by painting inside and out. The weight of the chimney is spread to the foundations in the same general way as that of the columns of the building, the base or foundation on which it rests being constructed in the same manner. The ground is first covered with a layer of cement, then two layers of steel rails in cement and one layer of I-beams, on which the cast-iron shoe which takes the shell of the stack rests. The capacity of the chimney is twelve 60-inch boilers 20 feet in length.

This is the first time this material has been used in the construction of the chimneys of mercantile buildings. The magnitude of the building and the necessity of economising in space, the foundations for the columns occupying about all the ground, led the architects to adopt steel as the material for this purpose. Brick has been used almost entirely heretofore, but upon investigation it was found that the weight of a brick chimney of this size would be almost 700 tons, while of steel construction it would weigh, including the linings, a little less than 250. The outside diameter of the present chimney is 9 feet 5 inches, while, were it constructed of brick, it would be 16 feet 6 inches, thus making a great saving in space. Another consideration was the time consumed in construction. A brick chimney of this height, 250 feet above the sidewalk, should not be built faster than 2½ feet a day on account of the settlement and the setting of the mortar, while of steel

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1 inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors and Street Paving.

"ECLIPSE" PORTLAND CEMENT

Quick setting; test, 3 parts. Standard Testing Sand, 230 lbs. per square inch; 28 days. The finest, most plastic, best sand carrying, and cheapest Cement in the market. Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c.

Samples sufficient for Practical Tests Free. Manufactured by

JOHN BOARD & CO., Dunball, Bridgwater.

ESTABLISHED 1844.

it can be erected at the rate of 20 feet a day. Another important consideration is that it costs only about 60 per cent. of what a brick chimney would cost. Steel has been used in the construction of chimneys for iron mills and factories.

TRADE NOTES.

MR. JOHN GRUNDY, of 30 Duncan Terrace, London, N., is supplying his patent warm-air ventilating firegrates to the Brettenham Board School.

MR. J. E. NORTON (late of the firm of Hindle & Norton) has commenced business, after a dissolution of partnership, at St. Mary Street, Oldham, where he will continue to manufacture the "Acme" and "Paris" spring hinges.

A NEW system of stable drainage has been brought out by Mr. A. J. Bewick Ward, 15 Great George Street, S.W., which does away with all urine-trapped pots in the stable, with a specially-designed interceptor outside. They are well planned, simple in construction and easily fixed. Architects and others having stablework in hand should write for particulars, as they are a step in the right direction and a valuable improvement in sanitation.

MR. MORGAN WILLIAMS, A.M.I.C.E., M.A., formerly installation engineer to the Electrical Power Storage Company and the Electric Construction Corporation, has now entered into partnership with Mr. Frank King, M.I.E.E., and the firm are practising as consulting electrical engineers under the title of Messrs. Morgan Williams & King at 39 Victoria Street, Westminster. Messrs. Morgan Williams & King intend taking up in electric lighting matters a position precisely similar to that of an architect in relation to their clients.

THE new schools, Taunton, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

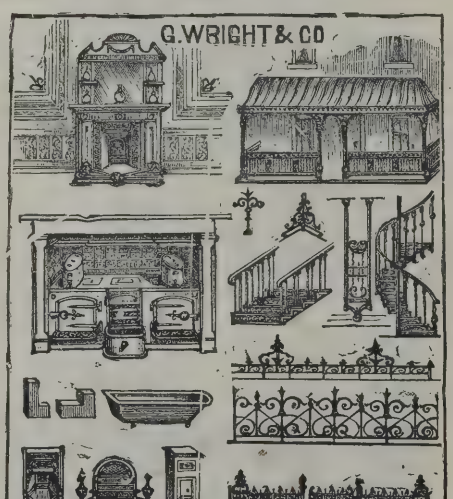
THE advice has been taken of an electrical engineer with a view to the laying down of plant for supplying electricity for lighting the borough of Accrington, and a report will shortly be submitted to the Town Council.

AN interesting series of experiments lately took place on the Southwark and Vauxhall Waterworks Company's premises, Battersea, when an exceptionally powerful steam fire-engine, constructed to afford more effectual protection against fires in the lofty buildings erected in Sydney, N.S.W., was publicly tested in the presence of Sir Saul Samuel, K.C.M.G., Agent-General for New South Wales, the inspecting engineer appointed by the Sydney Fire Brigades Board, representatives of the insurance companies and others. Steam was raised to 100-lb. pressure in 10 minutes 24 seconds, and various jets up to $1\frac{3}{4}$ inch were thrown, the last-mentioned reaching to a distance of 318 feet. Afterwards four 1-inch streams were thrown simultaneously to a great distance. The engine has a capacity of 1,000 gallons per minute, and has been built by Messrs. Shand, Mason & Co., of Blackfriars, London. The trial gave very great satisfaction, much astonishment being expressed at the force and solidity of the streams, and the distance to which they were thrown, coupled with the smoothness and ease with which the engine worked throughout the tests. This powerful extinguisher will leave for its destination very shortly.

WE understand that Mr. C. H. Mabey has moved from 1, 1A and 2 Princes Mews, Westminster, to more convenient premises, viz. 150A Vauxhall Bridge Road, about five minutes' walk from Victoria Station.

A REPORT has been presented to the Halifax Council meeting by Mr. J. H. Woodward, of Wolverhampton, with respect to the construction and working of a central station in Halifax for supplying the electric light. The report proposes to locate the central station at the late Salvation Army barracks, Stead Street, and that it should be worked by steam-power. The estimated capital outlay is put down at 52,594*l.*, and the estimate of running expenditure at 7,508*l.* 5*s.* per annum.

THE work of putting in a new cable for the Highgate Hill Cable Tramway has just been completed, the old cable having become defective through wear and tear. It required thirteen horses to draw the new cable on a Midland Railway trolly up the steep hill on which the tramway is laid to the company's depôt on Friday.



THE matter of the alleged breach of contract with Messrs. William Gray & Sons, Frederick Street, has been considered by the Law Committee of the Edinburgh Town Council. A draft report was submitted from the Public Health Committee, and after considerable discussion the Law Committee were of opinion that it was quite within the competency of any committee to order work and furnishings from persons other than

the contractors, in terms of condition 2 of the general specification relative to city contracts.

At a private conference of gentlemen interested in the question of refuse-destructors held in Edinburgh, Professor Forbes, London, who, it is understood, has made a special study of the subject, submitted and explained some plans of refuse-destructors, which were found to correspond pretty closely on their general lines with the plans prepared by the Edinburgh burgh engineer. Professor Forbes also spoke in favour of the steam-power of destructors being utilised in connection with electric lighting.

At the meeting of the Wenlock Town Council a report was submitted from the Repairs to the Guildhall Committee, who had received tenders for the work specified by Mr. Lloyd Oswell, the architect, ranging from 680*l.* to 588*l.*, the lowest being from Mr. Bowdler, of Shrewsbury. This tender had been reduced by 118*l.* by substituting deal for oak and other slight alterations. This was accepted.

At Yarmouth the last block of concrete has just been placed into position in the new quay head at the Fish Wharf. The work has been all along under the personal supervision of the town surveyor, Mr. John W. Cockrill. The first block of concrete (of which the main portion of the quay heading consists) was made on March 25 last year, and from that date down to August 13 in the same year a large gang of men was employed in preparing the river bed at the side of the quay, erecting cranes and other necessary preliminaries for the proper carrying out of the work. On the latter date the first block was laid. The length of the new structure is 2,103 feet, and the depth 26 feet; the actual number of blocks laid is 4,780, the cubic contents involving the making of 12,281 cubic yards of concrete. The concrete wall is faced with granite, of which stone about 2,000 tons have been used. The total estimated cost was 26,000*l.*, but from statistics at present to hand it is believed that the cost will not exceed 24,000*l.* The old wooden quays have been all but renewed three times during the past twenty-five years, the cost being equal to the present work, and involving latterly a cost of some 500*l.* a year for dredging and repairs.

The Town Council of Kilkenny have accepted the proposal of Messrs. Waller & Manville to supply an estimate of the cost of the introduction of electric light into Kilkenny.

An application is to be made by the Town Clerk, Birkenhead, for sanction to borrow the sum of 1,999*l.* for the purchase of land in Livingstone Street and Price Street, as a site for one of the proposed refuse destructors, and a further sum of 3,300*l.* for the purchase from Mr. A. P. French of a piece of land containing about 8,000 square yards between New Chester Road and the Mersey as a site for the refuse destructor for Tranmere.

Tenders for lighting the township of Bray by electricity have been sent in to the commissioners.

At the Clerkenwell Police-court on the 7th inst., Mr. G. H. Croad, Clerk to the London School Board, was summoned by the Clerkenwell Vestry for neglecting an order to remedy the defective drainage of the caretaker's house at a Board-school. For the defence it was pleaded that, owing to the holidays, the matter had been overlooked. A fine of five pounds was imposed.

The Vestry for St. Pancras have resolved to reconstruct the sewers in Upper Woburn Place, on the east and south sides of Tavistock Square, on the west side of Gordon Square, in Gordon Street, Endsleigh Street and Endsleigh Gardens. Public pressure has been brought to bear on the Vestry.

The new and improved patent ventilators of Baird, Thompson & Co., the well-known ventilating and consulting engineers, of London and Glasgow, are being favourably received by the leading architects and others, and in order to keep pace with the growing demand they are making extensive additions and alterations to their present works, and in addition have leased new premises in Holloway, within which they are at the present time busy completing and laying down specially-prepared plant and machinery wherewith to turn out in still larger quantities the ventilating, heating and sanitary appliances which form the specialties of the firm. In these the firm have attained a prominent position, and they are justly celebrated both for their efficiency and first-class workmanship. The firm at present have numerous important contracts on hand, and their latest improved patent self-acting exhaust roof ventilator and their improved fresh-air inlet panel ventilator have recently been applied to numerous leading public and private buildings both at home and abroad. The extended works above referred to will be under the management of Mr. Robert Pollock, formerly and for many years manager of Robert Boyle & Son, of London and Glasgow, and a gentleman of extensive and varied experience. It is to be noted that a representative of Baird, Thompson & Co. is at present making a journey through the United States and Canada, and carrying through some important special contracts for the firm, besides extending the knowledge of their specialties generally. The head of the firm, Mr.

Apply to the Bath Stone Firms, Ld., Bath.

J. D. Gray Thompson, is at present engaged on an important sanitary treatise soon to be published, and expected to prove of the highest interest to all connected with sanitary science. The firm's revised catalogue is to be had on application at the London or the Glasgow office.

BUILDING AND BUILDERS.

A beginning has been made to restore the jute warehouses in Trades Lane, Dundee, which were recently damaged by fire. The two buildings, which were almost wholly destroyed, are not to be proceeded with meantime, and operations will be confined to the adjoining premises. Bailie M'Culloch is the architect.

At the meeting of the Wolverhampton School Board amended plans for the proposed Higher-grade School were submitted. Alterations had been effected to reduce the cost 2,500*l.*, so that the buildings would not cost more than 12,000*l.* The plans, subject to the sanction of the Education Department, were adopted.

The *Durham Advertiser* says:—The County Council are now replacing three of the old stone bridges in Weardale by girder bridges. White's Bridge, of one large arch, over the Wear between Westgate and St. John's Chapel, has been taken down, and the new piers are now ready for the girders. This bridge was built in 1745, and consisted of one narrow arch, an additional arch being added in 1803. Ireshopeburn Bridge, of one arch, and over a tributary of the Wear, has been taken down and the piers built, and the girders are being replaced. The third is that of the Wearhead Bridge, of two arches, and which still stands, but will be very shortly taken down. The picturesque old structure was built in 1768, and was widened by an additional arch in 1810. The ascent and descent on and from these bridges were highly dangerous, especially in winter

In connection with the parish of St. Michael and All Angels, Northampton, about 2,000*l.* is to be spent in the addition of further buildings to the already existent parochial room and schools. They are to consist of a large ground-floor hall, with stage or platform 82 feet by 39 feet in dimensions; two class-rooms at the Perry Street end of the structure on the same level; a couple more 20 feet square classrooms on the first floor; and kitchen, scullery and heating chamber in the basement. Mr. C. Dorman is the architect, and Messrs. Sharman the builders. The building will be of brick with Bath stone dressing, and designed to match with the church and present buildings.

A site has been secured at Clayton Heights, Queensbury, on which to erect a new Wesleyan school.

The committee of the Aston Technical School have decided to purchase a site in the Whitehead Road, and to erect upon it a suitable building in which to carry on their work. The cost of the site will be about 850*l.*, and it is roughly estimated that the whole scheme would necessitate the outlay of about 6,000*l.*

The Free Library Committee of the Nelson Town Council have decided to apply to the Local Government Board for sanction to borrow 7,500*l.* for the purpose of erecting a technical school and free library combined.

The markets committee of the Leeds Corporation have had before them plans prepared by Mr. Hewson, the borough engineer, for roofing in a portion of the Kirkgate Market at present unprotected. Although scarcely forming a portion of the market proper, the land to be so treated has been used on market-days by stallholders, and as they have experienced considerable inconvenience in rainy weather, the improvement is a most desirable one. The roof is to be of iron and glass, and will be constructed on the same principle as that of the Midland Railway Station at Bradford. Instead of one huge roof with large spans, the structure will consist of a system of iron girders supported on pillars very large distances apart, the girders in their turn carrying a series of small spans of roof.

In a letter to the *Leeds Mercury*, Messrs. Maxwell & Tuke, the architects of the Blackpool Tower, say:—The directors have decided to proceed with the erection of the tower at once, and the ironwork quantities are already taken, and the contracts will, we expect, be actually let within a fortnight. The work will be in operation before the end of the present month, and a great portion of the tower will be completed by July next. It may be interesting to your readers to know that in the matter of the London Tower, which is to be 1,000 feet high and will weigh 7,000 tons, no contractor has been found to undertake the completion in less than two years and a half from the time of signing the contract. Taking this into consideration, it is difficult to imagine how the rival tower, which h s only been dreamed of since the Blackpool Tower has been paut before the public, and which, we understand, is also to be

1,000 feet high, can be completed before our own, which is only half the height, and will not contain one-quarter the metal.

The Aberdeen harbour engineer, reporting on the foundations of Waterloo Quay, says :—"I propose to drive a row of greenheart or Jarrah timber sheet and bearing piles along the whole length of this wharf at a distance of 8 feet from the present front, the bearing piles to be driven to the boulder clay 11 feet deeper than the present piles, and the sheet piles into the gravel 7 feet deeper than the existing sheet piles. The space between the two rows of sheet piles to be deepened a foot and filled in with a mass of plastic concrete 8 feet wide by 9 feet deep. The weight of the concrete, 4½ tons per lineal foot, and the extra depth of piling, will allow the berth alongside to be deepened to the level of 26 feet at high water, and, with the addition of a row of anchor piles in the quay securing the top of the front piles, will make the quay wall permanently safe. The wharf would be extended to a total width of 18 feet, the cope lifted, the granite causeway extended to the front of the wharf and the rails shifted outwards. I estimate the cost of the extension of the wharf a length of 320 feet at 2,700*l.* The remainder of the length of Waterloo Quay westward 278 feet is secured by sheet piling 4 feet, and bearing piles 6 feet deeper than the eastern portion, and I consider it perfectly safe for the existing depth of berths. In consequence of the continued movement forward and subsidence of the portion of Waterloo Quay wall now under repair, the dam has had to be extended from 50 feet to 120 feet. On the completion of this part of the wall the dam will be taken down and a portion of it re-erected westward 70 feet. I propose to continue the wall in a straight line and build the west-end of this part of the wall in front of the existing wall to stand out 12 feet in order to strengthen the wall and give a square butt end to the timber wharf. The length of wall to be taken down and rebuilt is now found to be 160 feet (instead of 90 feet), and the estimated total cost, 3,500*l.*" The committee approved of the report.

VARIETIES.

The Gas Committee have instructed the town clerk to apply for sanction to borrow the sum of 60,000*l.* for proposed extensions of the Halifax Gasworks.

The South Stoneham Board of Guardians have received seven sets of plans for the proposed sewerage and sewage-disposal of Eastleigh.

The special autumn fashion number of the *Lady's Pictorial* is a wonderful production, containing over 150 pages, most lavishly illustrated with designs of the latest fashion in autumn dress.

The engineer to the Dover Board, Mr. Walmesley, together with Mr. Webster and Mr. Thorne, architect and contractor respectively for the Dover Promenade Pier, have fixed the position for the commencement of the work of building the pier, which will be carried out a thousand feet from the centre of the bay. A spacious pavilion will be erected at the end of the pier.

The Cambridge Town Council have adopted the scheme of Mr. John T. Wood, of Liverpool, for the redrainage of the borough at an approximate cost of 100,000*l.* Mr. Wood has also been called in to advise the Chesterton Local Board, who are desirous of joining the Cambridge scheme.

A report has been presented to the Dunfermline Police Commissioners by Mr. R. C. Reid, C.E., Edinburgh, upon the drainage of the burgh. Mr. Reid condemns the present system as inadequate, and advises that two sets of pipes be laid, so as to separate the surface-water from the sewage. A number of the old pipes, he proposes, should be utilised for conveying the surface-water, and new pipes provided for the sewage. The estimated cost of the alterations is 13,700*l.*

At a meeting of the Lord Provost's committee of the Edinburgh Town Council a statement was made as to the work of restoring and improving certain historical monuments in Greyfriars' Churchyard, which, for some time past, Mr. Morham, the city superintendent of works, has been carrying on. Mr. Morham asks authority to proceed further with the work.

At the meeting of the Dundee Water Commissioners objection was made to the proposal to lift, as an experiment, a quarter of a mile of the old Lintrathen pipe in the Valley of Strathmore, and substitute thimbles for the faucets, at an estimated cost of about 3,000*l.* The pipes were weak, it was stated, and the only satisfactory plan was to lift them altogether and relay them between Pitnappie and Clatto, where the pressure was not nearly so great. Ex-Provost Ballingall said that of one hundred bursts which had taken place, only in three cases had the pipe not given way at the faucet. If the experiment resulted satisfactorily, they would probably substitute thimbles for the fancets of the remaining four miles of piping, which would cost from 6,000*l.* to 8,000*l.* The proposed

experiment was agreed to by 20 votes to 4. The Commission resolved to complete the second Lintrathen main by laying another pipe between Pitnappie and Dundee, at an estimated cost of 29,282*l.*

DELEGATES of the joint authorities of Rhyl, St. Asaph and Abergele, have decided that steps should be at once taken with the view of promoting a Bill in Parliament for the compulsory acquisition of the Rhyl and district water undertaking for the supply of water for domestic, general and sanitary purposes within the respective districts.

AT a conference of medical officers of health at Leeds, the building of "back-to-back houses" was condemned, and also all houses that do not admit of thorough ventilation from opposite sides. The meeting pledged itself to use every effort to prevent the erection of any more such unhealthy dwellings.

THE Tees Commissioners propose next Parliamentary session to seek power to raise an additional 150,000*l.*, of which 80,000*l.* is to be spent in dredging operations to improve the draught of water, and for making the proposed railway on the north side of the river, for straightening the river, and for works of reclamation.

AT Penge a movement is on foot to secure the establishment of public baths. There is also a movement in the neighbouring parish of Beckenham for public baths and a free library.

AN inquest has been held regarding the death of Mr. John Cochrane, the contractor for the tunnel under the Mersey at Fidler's Ferry, through which the pipe line is to be passed. Mr. Cochrane shot himself in his London office, and the coroner's jury gave a verdict of suicide whilst temporarily insane. Evidence was given to show that the deceased was much worried about business matters, and it is believed a full share of his troubles arose from the unfortunate Fidler's Ferry undertaking.

IT has been decided to appoint a special committee to consider the desirability of establishing a cottage hospital in connection with the Stourbridge Dispensary.

THE Corporation of Barnsley have given notice of intention to apply to the Local Government Board for an order giving them the power to take, compulsorily if necessary, the property in New Street which will be required to make the improvement contemplated in that street. The whole of the property on the south-east side of the street has been scheduled, and it is expected that the gross cost will be 15,000*l.*, the net cost to the town being probably 10,000*l.*

MR. E. G. HUTCHINGS writes :—"Whilst reading the article in your paper *re* the smoke nuisance of London and the best means of abating the same, it occurred to me that since gas, water, sewage and other things are conveyed underground, could not a similar means be brought into use for the disposal of smoke, *i.e.* by a system of underground shafting with the flues of furnaces connected thereto and drawn or driven along the mains by fans or other means away into the country? I am well aware that, if such a plan were at all practicable, the obstacles in the way and cost would be prodigious. The idea perhaps is altogether ridiculous in the extreme, or it may have been suggested before. I am not aware that it has."

THE Penistone Local Board, Yorkshire, have arranged to supply a large quantity of water to several adjoining districts, and it will be necessary to put down additional duplicate pumping machinery, and otherwise alter and extend their works to provide the additional supply and prevent the possibility of a breakdown. The Local Board have called in Mr. W. H. Radford, C.E., of Nottingham, to report on the present system, and advise them as to the proposed works.

ABERDEEN UNIVERSITY.

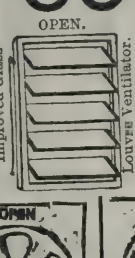
THE *Aberdeen Free Press* reproduces the following extract from an article on "Extension of the Buildings," one of the series of papers on "The Progress of Aberdeen University during the Last Thirty Years," contributed to that journal by Emeritus Professor Struthers :—

The questions are, What new buildings are required? where they should be placed? and how the funds are to be procured? The first necessity is a new chemical laboratory. It is not creditable to Aberdeen at this time of day to have little else than a series of dungeons for a subject so important not only in a school of science, but to the material interests of the district. Beyond all question that is the most pressing requisite. That will require 10,000*l.*, and to do it handsomely 3,000*l.* should be added to provide an annual sum for apparatus and laboratory expenses. For that purpose 5,000*l.* would not be too much, giving an annual sum of 150*l.* Next, if Aberdeen wishes to have a complete school of the physical and biological sciences, the department of physics should be provided for alongside of the chemical department, at Marischal College, if that is to be the site. I do not say this merely because after this year physics

MAW & CO., LIMITED, will forward on application Pattern Books or Special Designs, with Estimates for all kinds of Floor and Wall Tiling. Patterns can also be seen and particulars obtained at the Show-rooms of their appointed London Agents, Messrs. W. B. SIMPSON & SONS, 100 St. Martin's Lane, W.C.

will come within the medical curriculum. I said in my evidence before the Royal Commission of 1876, "I think that not having natural philosophy besides the other sciences in Marischal College was the one mistake of the arrangements at the time of the union of the two colleges," and "I hope this will be rectified when the day comes for extending the buildings of Marischal College." The clearing-out of that department from the present buildings at King's College would give what additional room may be required there. Professor Niven could say more exactly, but I doubt whether a physical laboratory worthy of Aberdeen would cost much less than the chemical laboratory, but the laboratory part proper of it would not require to be so large as for chemistry. There is already the Mrs. Neill Arnott gift of 1,000*l.* to provide an annual sum for apparatus, but that is insufficient.

As to the wants of the medical school proper, apart from the above. The recent addition made by the Government along the outside of the south side of Marischal College has given full accommodation for several of the departments. A like addition along the north side would give more accommodation than is required for the remaining departments, and at the same time provide accommodation for the growth of the science and medical parts of the library kept at Marischal College. I would like to remark here on what seems to me the want of guiding principles in regard to the arrangement and size of the rooms for the medical departments. The Botanical Department should have been provided for beside the Natural History Department, so that the museums for geology, zoology and botany would be continuous or contiguous, thus devoting the south wing to the natural sciences along with physiology, leaving the north wing, with its future extension, to provide for the professional subjects, with a general museum for these subjects. When the north wing is extended such an arrangement should be kept in view. Instead of having a number of little separate museums for pathology, surgery, medicine, gynecology, medical jurisprudence and drugs, these should form one general museum, into which the students could go at any time and study the specimens in the cases, the specimens all labelled to facilitate objective study. There is, of course, some inconvenience in carrying the specimens to and from the lecture-rooms, but that is a minor consideration. The study of specimens on the shelves is the main object of a museum. Such a museum is itself a school, and of more value to the student than lectures. Each professor, if he liked, could have the key of the cases containing the specimens belonging specially to his department, and there should be a curator or skilled attendant, who would always be present and working for the whole museum. Such a museum-room could be well provided for in broadening the north wing, and the inconvenience of carrying specimens to the lecture-rooms would be minimised by these lecture-rooms being, as suggested, placed in that wing.



Then, as to the size of the lecture-rooms. It was stated lately, in an account of the new rooms in the south wing, that one of the lecture-rooms is seated for 240, another for 250. I have seen a plan for a surgery lecture-room on a light scale. Is that necessary or right in a school entering about 100 new students a year? When will Aberdeen come to learn that the hospitals and dispensaries are the laboratories for medicine and surgery, and that the place to learn midwifery is at the bed-post? And, along with these, private study. The "spoon meat" of the college lecture-rooms with which we feed our medical babes is for the most part only talk about medicine, surgery and midwifery, not the thing itself. This is not the question of the expected reduction under the new ordinances of the number of lectures in each course, which still go on in addition to the new and really useful practical courses. It is a question of reattendance on the same course of lectures. The day is past for that, but great big lecture-rooms are a temptation to it and provision for it. Go the round of the medical schools, and you will find the anatomy lecture-room bigger than the other lecture-rooms, the custom having been to go twice—in the old days even thrice—to the same course of lectures. But anatomy lectures are not lectures, but demonstrations. When I planned, under the old custom, and in consideration of the subject, the new anatomy lecture-room seventeen years ago, it was seated for 180, not 250. But I would not plan it so large now. Students ought not to attend twice the same course of lectures, not even in anatomy. The University Court ought not to allow it. In anatomy there ought, in my opinion, to be a junior and a senior course, each on three days a week; and if there is to be any second attendance on lectures on any other subject, the Court ought to require the Professor to give the two courses at different hours, or on alternate days. If any class is within two faculties, and the number very large, the Professor should be required to lecture to each separately, as the value of demonstrative or experimental lectures is greatly diminished if the class is very large. The day, therefore, for providing monster lecture-rooms in a University for science or medical teaching is past. The University Court and those who are to give the money should see to that. The present medical

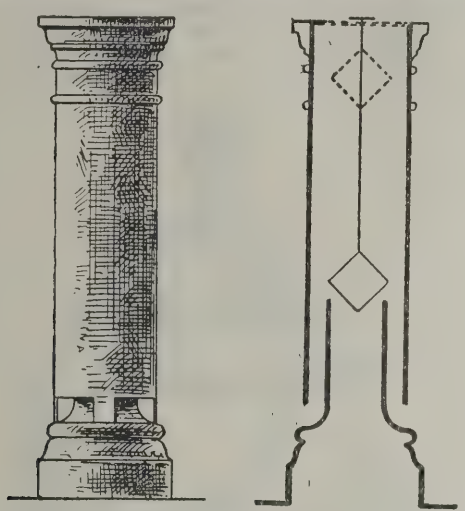
lecture-rooms at Marischal College are already large enough for all who ought to be there in a school entering about 100 new students a year, according to modern views of medical education. The school may increase. That is not improbable to some extent for a few years, from the name it has got. But the fact is, however unwelcome the thought, that we have already more than we can teach practically, especially clinically, and when that is found out, and when the movement for medical graduation in London on the Scotch footing is completed, and when, by-and-by, Forfarshire is taken from us by the new school of Dundee, we may rather expect some diminution, and that will be no discredit to the Aberdeen school. I have always said our medical school will be safe as long as it had 300 students, and that will always be a creditable number for Aberdeen to have, with its limited hospital power. Even in view of any possible increase, no new medical lecture-room here ought to be planned to hold more than from 130 to 150. Look at the celebrated new buildings for science and medicine of the German Universities. The Scotch eye is at once struck with the small size of the lecture-rooms and the large size of the laboratories.

As to the locality of the new science buildings, I venture to ask for a moment the suspension of some Aberdeen prejudices. It cannot be at Marischal College, without at great cost for the purchase of surrounding properties, and without in the end being cramped for space and surrounded by slums. It is no use shutting our eyes to all that. Delays and delays till young professors have grown grey, unsatisfactory results in the end and melancholy surroundings. But there is plenty of ground at King's College without a sixpence to pay for it. A series of handsome science buildings, contiguous or continuous, a second and larger quadrangle it might be, could be erected there for chemistry, physics, geology, botany and zoology, archæology too, if you like; laboratories and lecture-room below, a suite of continuous museums above; all according to modern ideas, plenty of space and air and pleasant surroundings; all at less cost than anything approaching to it is possible at Marischal College; a complete school of the natural sciences, physical and biological, of which Aberdeen would have reason to be proud as the best in Scotland. Professors and statesmen in Germany would at once decide for that, glad to have such a site, and one would expect that professors anywhere who are in love with their work would jump at such a prospect as the happiest life they could lead, every modern provision for teaching and research, good museums, happy surroundings, and if they liked, their houses and gardens close by. If any of the good folk of the town are opposed to this proposal, send them as a deputation to Germany, say to Bonn and Leipzig, and they will come back wiser and converted men. Marischal College, as it now is, would then provide all that the medical school proper requires. Pathology would move into the natural history rooms, and the museum-room would be the general museum of the medical school, already indicated; and there would be some rooms to spare for other purposes. It would still remain for the town when it liked to make the street improvement by removing the old houses of Broad Street, and for the old church to be dealt with as might be desired.

But if Aberdeen is hopelessly joined to its old idols, the question is, where can the new buildings at Marischal College be placed? The "opening up" of Marischal College by removal of the old Broad Street houses is to be regarded as a city improvement, to be done by the Town Council. That will take from 15,000*l.* to 20,000*l.* The College is not going to spend its money on letting the public have a view of it. The entrance is shabby, but many good men have gone in and out at that venerable gate, and may still do so till the Town Council is pleased to make the clearance. Nor is the ground on which the old church stands necessary to the College. Let those who looked to getting a good church bargain out of the necessities of the University abandon that hope. The church may stand. When the Broad Street houses are cleared, the frontage and south end of the church will be not amiss to look at. Seen from the college it is certainly ugly—hideous, indeed. It looks best at midnight, when I have often seen it, with perhaps a touch of moonlight, which

> Leaveth that beautiful which still is so,
> And maketh that which is not.



Perhaps Byron, who lived close by, got his inspiration for that from it before he saw Rome. We hear of the idea of "restoring" the old edifice to the tune of some 3,000*l.* If so, the subscribers for University extension will no doubt see to it that their money does not go that way. From recent church extensions in and about the city, still going on, it would appear that the Established Church is in good funds. The best way to deal with the old church is to photograph it, and remove it, bag and baggage. It is not needed for a graduation hall—we have that; and as to converting it into an antiquarian museum, however appropriate in idea, it would be ill-fitted for such a purpose, and the ugly edifice would still be there unless at great cost for

external adornment. It seems never to have occurred to the few persons who are shocked at the idea of the old church disappearing, that a contemplated removal of the old Broad Street House Byron lived in would be a worse piece of vandalism.

NOTES ON NOVELTIES.

Chimney-cowls.—We have had lately brought to our notice a chimney-cowl manufactured by the Climax Ventilating Company, of 15 Great George Street, Westminster, of which we now illustrate the plainest design, and it will be seen that even this has a good appearance, while an octagon design which they make has a decidedly architectural treatment. It will be seen

from the section that the apparatus is extremely simple and is not liable to get out of order. It is free from all noise, is easily cleaned, and its efficiency is most highly spoken of, as from whatever direction the wind blows it is deflected vertically across the space between the extremity of the cone and top of the inner pipe in connection with the flue, creating a powerful upward current without the possibility of a blow-down.

LUGWARDINE WORKS, WITHINGTON.

A VISIT has just been paid to the works of Messrs. William Godwin & Son, ecclesiastical and art tile manufacturers, by H.R.H. the Princess Mary Adelaide, Duchess of Teck, H.R.H. the Princess Victoria Mary of Teck and H.S.H. the Duke of Teck.

Intimation of the visit was received about noon on the day, and preparations were at once made for the reception of the Royal party. They arrived at the works about a quarter to four, and were received by the proprietor, Mr. Godwin, and the manager, Mr. Pickerill, the drum and fife band of the works playing the National Anthem.

The Royal visitors were accompanied by Mr. Michael Biddulph, M.P., Lady Elizabeth Biddulph and a distinguished party, numbering in all fourteen, who were paying a visit to the Lady Emily Foley. The party were conveyed in her ladyship's carriage, and a drag drawn by four splendid horses, driven by the owner, Mr. Booker. The Duke and Duchess and party were conducted by Mr. Godwin and the manager over the works, and the different processes of the manufacture of encaustic and other tiles were fully shown and explained, the Royal visitors appearing to be much interested and pleased with what they saw. The manufacture of the inlaid or encaustic tiles was watched closely, and was a source of much interest—so much so that the Duke, Duchess and the Princess Mary inscribed their names on the backs of some of the tiles they had watched being made, and these will in due course be forwarded to their Highnesses. Messrs. Godwin & Son's art tile chimney-pieces, with tile interiors, were also much admired, several sets eliciting much praise. The Royal party also manifested much interest in the copies of the Early English ecclesiastical tiles, the Duke especially desiring to take with him some specimens similar to those he had seen in the Priory, Malvern. The Duchess and the Princess Mary also desired some of the tiles which they had seen and admired to take away with them as souvenirs of their visit—a request which was most readily granted.

On the completion of the visit, which lasted nearly two hours, the Royal party signed their names in the visitors' book, and expressed to Mr. Godwin the pleasure the visit had given them. Graciously shaking hands with Mr. Godwin, also with Mr. Pickerill, they left for Stoke Edith amid the cheers of the workpeople.

MOVABLE TABLE TELEPHONE.

Patent No. 5,008, 1890.

TELEPHONES! TELEPHONES!!

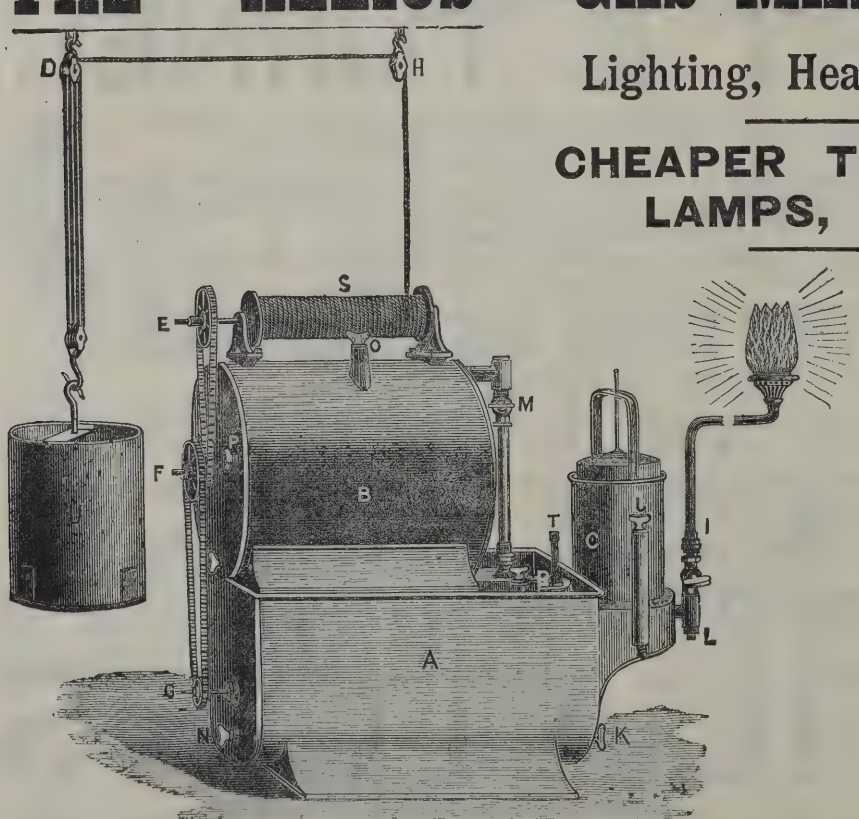
The drum and fife band of the works played a selection of music during the visit, the Duke personally thanking the players.

IMPROVED TELEPHONES.

Messrs. Grist & Turner, of 53 Gracechurch Street, E.C., and 61 Piccadilly, Manchester, have recently introduced several important improvements in connection with the simplifying of telephonic communication. We shall call attention to two of the specialties of this firm. The first is the "Sphinx" telephone, which is claimed to be 50 per cent. cheaper than any manufactured instrument in the market. It conveys the sound as clearly as any telephone in existence, and a test of forty miles distinct—which took place satisfactorily in our presence—must obviously stamp the "Sphinx" telephone as adequate for all commercial purposes. The convenience of an improvement which dispenses with the trouble of the central station system to large firms having a number of clients to communicate with can hardly be overestimated. This system is known as the "intercommunication system," distinguishing it from the central office system. It admits of speaking direct without the circumlocution usually necessary in calling up a central exchange—an advantage which must have a great influence on the promptness of business relations. It may be pointed out, too, that an enterprising firm might originate a telephonic centre from its own works to its customers—continually by that means increasing their number—or branches in one town might thus be connected with the head offices at a considerable reduction in the expense of individual connection with an exchange system. A case in point is the Co-operative Society of Manchester, a firm with upwards of sixty branches in the locality, who have adopted this direct system. Messrs. Grist & Turner have carried out the work most successfully, a result which has induced many other firms about Manchester to do likewise. We may mention amongst others Barlow & Jones, Limited, Bolton; Thos. Taylor & Sons, Limited, Bolton; Simpson & Godlee, Manchester; Hulme Bros., Manchester; W. E. Buckley & Co., Limited, Bury; &c.

We should mention that although Messrs. Grist & Turner claim to do the cheapest work in the market, they insist particularly on its quality and the excellence of the materials used. Every telephone is made under personal supervision and the materials are carefully selected. Fowler-Waring cables, for instance, are used by the firm in all their installations, the name of which is a guarantee of excellence. Amongst users of Messrs. Grist & Turner's "Sphinx" telephones, for domestic purposes, may be mentioned the following:—The Right Hon. Earl Beauchamp, Sir R. Harvey, Colonel S. B. Bevington and Sir Henry Meux. It is only natural that, with this evidence of success, Messrs. Grist & Turner should lay claim to one of the best and cheapest telephones produced, which will get more widely used as its merits are known.

Messrs. Grist & Turner have also turned their attention to the necessity of a combination moveable telephone, and the result is an invention which has not yet made its way into the market, but of which we are enabled to give a few details. We think we are justified in asserting that nothing of the same kind has ever been accomplished previously. It consists of the combination of bell, telephone and switchboard in one. The illustration accompanying shows the compactness and ornamental character of the patent, no less than its handiness and utility



Its use in clubs, flats, offices, seems only a matter of being known, and we anticipate that such a useful little contrivance, through which can be heard the faintest whisper, will for short distances supersede larger telephones. It lies on the desk, and is quite

THE "HELIOS" GAS-MAKING MACHINE

FOR

Lighting, Heating, and Motive Power.

CHEAPER THAN COAL GAS, OIL LAMPS, OR ELECTRICITY.

This Machine is the latest development of the Oil Gas systems. In most other such machines Gasoline is the gas-producing material, and as this can only be procured in large quantities, and is dangerous to store, there is naturally a great objection to its employment. The "Helios" Gas Machine is charged with Benzoline, which can be procured anywhere in large or small quantities. The Machine is simple, and the light produced far superior to coal gas. Machines made to supply from 6 to 2,000 lights.

Prices from £10 10s.

UNEQUALLED FOR

COUNTRY HOUSES, FACTORIES, HOTELS, &c.

FOR FURTHER PARTICULARS APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,

14 PALMER STREET, WESTMINSTER, LONDON.

complete in itself, whilst the tedious bawling and ringing is quite dispensed with.

We would call the attention of architects to the two inventions alluded to, which will relieve them of many of the difficulties attending the efficiency of telephones and will give satisfaction to their clients. We may add that Messrs. Grist & Turner have a department for electric light, and several installations in hand.

TECHNICAL SCHOOL, LIVERPOOL.

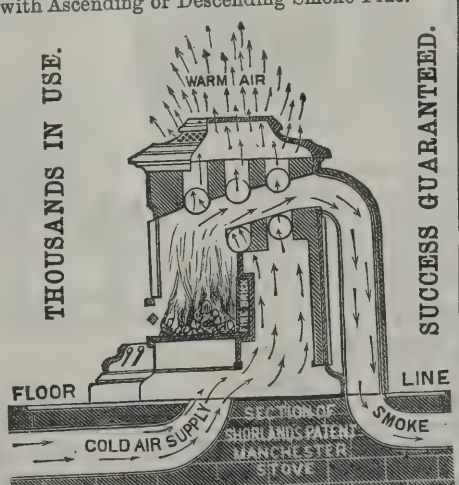
A BUILDING specially constructed and furnished for providing technical instruction to evening students has been opened at 21 Islington Flags, a few doors above the Walker Art Gallery. From front to back the length is 121 feet, and 21 feet wide. There are four storeys in height to Islington, and two storeys high at the back, fronting to Islington Place. The front is of Classic design, and the entrance is by a fine glass-fronted door direct from the pavement. In the vestibule are two doors, one leading into the secretary's offices, and the other into a long corridor, from which are the entrances to the physics department and electrical laboratory, the engineering department and the staircase leading to the drawing and brickwork and masonry department. The electrical laboratory is 67 feet by 18 feet, having a concrete floor and roof light, and being fitted with working benches, masonry piers for galvanometer, &c., accommodation being provided for about thirty students doing practical work. The work in this department is designed to meet the requirements of electrical engineers and others who desire an acquaintance with practical electrical testing, a large quantity of general electrical apparatus and various testing instruments being provided. The course of instruction consists of a lecture of an hour's duration in the adjoining lecture-room, after which the students proceed to the laboratory and devote the rest of the evening to practical work there, the nature of which will, as far as possible, bear upon the subject matter of the lecture.

The physics lecture-room adjoins the laboratory, provision being made for a full experimental treatment of these subjects. Owing to the liberality of Mr. Henry Tate, who has generously added to his previous aids to the cause of education both in Liverpool and in London, the committee will now be enabled to complete the electrical laboratory by putting down electrical light installation for experimental work, which will very materially add to the educational value of the institution.

The engineering classes embrace the following subjects:—Practical plane and solid geometry, machine construction and drawing, applied mechanics and steam. These will be held in the main lecture-room on the ground floor and in the lecture-room immediately above. The lower room is 51 feet long and 19 feet wide. It is fitted up with a view to the experimental treatment of the subjects, and the large amount of general apparatus which is available, together with the testing machine presented to the school by the late Sir C. W. Siemens, F.R.S., and a screw-cutting lathe for the preparation of specimens, &c., will enable the instruction to be carried on in a very practical manner. In the lecture-room devoted to brickwork and masonry at the rear, which is 38 feet by 19 feet, there is provided benches specially made, tools and materials for modelling. The different constructions for masonry will be modelled, and special attention will also be paid to brickwork.

The carpentry-room fronts to Islington (31 feet by 21 feet). Benches, tools and a large stock of timber are provided for these, the oldest technological classes in the city. Living specimens of the most common timber trees will also be provided in due course. The student will thus be enabled to work instructive examples in wood for himself at the bench, and to learn thoroughly the nature and properties of the timber with which he has to deal. The instruction will be purely technical, properly so called, and carpenters and joiners only are invited to attend. The course, commencing with simple joints, will include hand-railing and work of double curvature generally, so that apprentices and journeymen alike will be provided for.

In the modelling-room separate tables and stands are provided for each pupil, together with examples for art students in figures, busts, and natural conventional foliage. Special arrangements are made to meet the requirements of amateurs, who have only to provide simple tools at the cost of 2*s.* or 3*s.*



The department devoted to typography and to lithography will be held in the same room, 31 feet by 21 feet. The work here will be purely technical and devoted to the members of the letterpress and lithographic trades only, most of the lessons being fully illustrated by work executed before the students.

The plumbers' workshop in the basement is 28 feet by 20 feet, and approached from the main stair, centrally situated in the building. It is so situated that the noise associated with the manual practice of a score or more of plumbers simultaneously may not interfere with the more sedate studies in other parts. It has been carefully fitted with all the usual and most modern appliances of a well-equipped workshop, and from what has

VOLUME XLV. OF THE ARCHITECT
Handsomely bound in Cloth, Gilt Lettered, price 12*s.* 6*d.*
Offices: 175 Strand, London, W.C.

already been done it may be judged that the session will bring forth some excellent workmanship.

The benches have upwards of 100 feet frontage, are wide and very substantial in construction, being brilliantly lighted—an indispensable adjunct. Special attention will be devoted to pipe-bending for sanitary work, and ample provision for heating solder is made by six powerful gas burners manufactured for this purpose. Tools and materials will be provided for all students, and it is confidently assumed that the most successful of all the successful classes carried on by Mr. Mathias, who has this time the assistance of Mr. Henry Clay, during the past seven years will be an accomplished fact.

The want of a practical plumbing class seems to be keenly felt, and students who have from time to time inquired for this should send their names early to the secretary so that no time may be lost in preliminaries. The theoretical class will be continued, as previously, at the Free Library on Tuesday evenings. Other work will be carried on, such as photography, art drawing, shorthand, mathematics, &c.

There are suitable sanitary conveniences. The lighting and ventilating are executed by the well-known firm of Sugg & Co. The heating throughout is by means of hot-water pipes. The general contractors for the alterations and improvements were Messrs. J. Henshaw & Sons, of Chatham Street, who have carried out the work under the direction of the architect, Mr. J. Francis Doyle, Harrington Street.

The building sub-committee who have been instrumental in designing the arrangements consisted of Messrs. J. W. C. Haldane, Henry Duckworth, T. Gee and Dr. Gustaf Shack-Sommer, and they have acted under the advice of the various teachers.

THE EXCAVATIONS AT SILCHESTER.

THE following account of the systematic excavation of the Roman city at Silchester, begun last year under the auspices of the Society of Antiquaries, which has been steadily and quietly carried on for the past four months, has been given by Mr. W. H. St. John Hope :—

In continuation of our system of working out the site by the squares into which it was divided by the Romans, the work this year has been confined to the two squares, or *insulæ*, immediately to the west of the great basilica—that is, in the centre of the city ; and also to the completion, since harvest, of the large *insula* north of the forum which was undertaken last year. The northern of the two new *insulæ*, the cost of excavating which has been undertaken by Dr. Edwin Freshfield, treasurer of the Society of Antiquaries, has yielded very interesting results. The centre of it seems to have been chiefly open ground or gardens, with buildings ranged round the four street sides. These include the more or less perfect remains of a number of shops and houses, the latter having rooms warmed by channelled hypocausts and floored with mosaic pavements. One very perfect set of shops has been uncovered, attached to a small but complete house, with winter room warmed by a curious composite hypocaust, and a principal room with mosaic floor of unusual pattern. A model to scale of this interesting group is in course of construction.

The rubbish pits scattered over the *insula*, like those found last year, have yielded a great many interesting and curious objects. Chief among these are the fictile vessels, of which a considerable number of more or less perfect specimens have been unearthed, representing all the principal kinds of Romano-British pottery, as well as the imported pseudo-Arretine. Of minor articles in bronze (including a beautiful little enamelled stand), bone and glass, many interesting examples have come to light, together with numerous coins, though mostly in indifferent preservation. The pits have also yielded great quantities of animal bones, which are now under examination by experts. Among them is the almost complete skeleton of a Romano-British dog.

The architectural fragments do not include any of great importance, but a base of a column of good design and workmanship may be noticed. A small and perfect mosaic pavement in one of the houses has been successfully taken up for preservation. The southern of the two new *insulæ* has been excavated at the cost of the late Mr. Walter Foster, whose premature death in July last is a sad loss to his fellow-workers at Silchester. This *insula* has also yielded many interesting remains from its very numerous rubbish pits, including pots and vessels of all kinds, a quantity of fruit-stones and fish-bones, a set of bronze bucket-handles, a bronze bowl or saucepan, fibulæ, pins and other objects. From the trenches have also been unearthed various antiquities, part of an inscription on a Purbeck marble slab, coins and a number of interesting architectural fragments. Like its fellow this *insula* contained a good deal of open ground, but among other buildings, &c., uncovered is the complete ground plan of a house, a large series of chambers of uncertain use, a remarkable pavement of hard white *opus*

signinum and the remains of other houses and hypocausts. The tesselated floors in this *insula* are, unfortunately, but ill-preserved. Close to the house mentioned above a well lined with wood has just been discovered and is now being cleared out.

The excavation of the uncompleted insula north of the forum has only been begun since harvest, and the work is still in progress. Already the enclosure of probably a small shrine or altar has been uncovered, and a series of chambers along the main street. Some interesting remains have also come to light, including a perfect bronze figure of a goat, of good workmanship, and a considerable fragment of some rare foreign marble, used probably as a wall lining. Another, but lesser, piece of the same kind of marble was found earlier in the year in a different part of the excavations.

On the whole, the results of the season's work have so far been satisfactory, the find of pottery and earthenware vessels being very encouraging. A valuable addition, too, has been made to our knowledge of Romano-British building, showing the differences that exist between the town houses of Silchester and the country houses or villas. Both again differ in a remarkable way from the typical Roman house as seen in Italy—a fact that cannot be too often insisted on.

Amidst the mounds and heaps of displaced soil it is difficult for a casual visitor to Silchester to form any definite ideas of the plans and arrangements of the different foundations uncovered, and it is as well that those who desire to see the works still in progress should bear this in mind, and so avoid disappointment. In all probability, too, all the plans, drawings and models, and the whole of the antiquities found, will be exhibited at the rooms of the Society of Antiquaries at Burlington House during the winter, when those who are interested will have every opportunity of seeing them. A similar exhibition in January last of the result of the previous year's excavations was most successful.

Through the kindness of the Duke of Wellington, all the antiquities found at Silchester will be deposited in the Reading Museum, where the objects found last year have already been placed. An excellent nucleus of what will in time be a most important Romano-British collection has thus been formed.

If the excavations are to be carried on, as proposed, year after year, till the whole of the hundred acres within the city walls has been examined, funds must, of course, be forthcoming, and the treasurer of the Excavation Fund, Mr. F. G. Hilton Price (1 Fleet Street, E.C.), or myself, will gladly receive and acknowledge subscriptions. So important, not to say national, a work must not be allowed to flag, and it must surely be possible to find imitations of the excellent example of Dr. Freshfield and Mr. Foster in defraying each the cost of excavating an *insula*. It is also clearly the bounden duty of the Reading people, whose museum will so largely benefit by the excavations, to come forward in the same laudable manner.

Since our (at present) scanty knowledge of the civil life during the Romano-British period can only be increased by the judicious use of pick and shovel, it behoves everyone who is interested in the early history of this country to assist in the excavation of the Romano-British city at Silchester.

SILICIOUS PAINTING.

Dr. Fuchs, of Munich, discovered a method of painting which he called stereochromy. The want of a vehicle more enduring than those formerly in use and less liable to injure the colours employed, led to this discovery. Dr. Fuchs's method consists in the use of soluble silicates as the fixing material, and has been applied with considerable success on the Continent by German artists of distinction, and in this country by Mr. Herbert in the Houses of Parliament and by others.

The adoption of decorative and monumental painting for the embellishment of public and private buildings has rendered necessary some changes in the older processes of painting, because the requirements are different. Wall-paintings are more exposed to destructive influences than paintings on panel or canvas: the wall itself is more absorbent; the accumulation of dirt, which has from time to time to be removed, the impossibility of giving the same care to their preservation as to those of smaller size which are movable, render the employment of a different method of painting necessary and one which will leave the picture in such a state that it may, so to speak, take care of itself, and be independent of any further attention than that which is required to keep it clean, and for the cleaning process its surface must be such that it cannot be readily injured.

Oil-painting is unsuited for wall pictures on account of the glossy surface which it leaves, and for other reasons into which it is not necessary to enter here. All the expedients which have been tried to get rid of this defect have failed, because they have interfered with the permanency of the work.

Fresco-painting is open to many objections. In a damp climate it is not enduring. It is well known that the face of a plaster wall is destroyed by damp; and a fresco painting is nothing more than a plastered wall with a coloured surface, rendered more perishable by the colours, which, to some extent, interfere with the coherence of the particles of lime and sand forming that surface. The painting is executed while the wall is wet; water and lime only are used with the colours; their adhesion, therefore, is effected by the same power which binds together the other constituents of the wall, viz. the union between the lime and sand; and inasmuch as most of the colours form no compound with lime or sand, they must tend to weaken by their presence the cohesion between these substances by interfering with their perfect contact. The manipulation in fresco-painting is difficult, requiring great care and skilled labour of a particular kind, only to be acquired by long practice and considerable observation, and is, therefore, unfit to be entrusted to workmen of the kind usually employed in decorative work. From the slowness of the process, it becomes very expensive, and this alone would prevent its general use, even if it were in other respects satisfactory.

Silicious painting seems to supply all that is wanted for beauty and stability. It makes the surface of the wall almost impervious to moisture, it fixes the colours firmly to the ground, it leaves no gloss, and, as will be seen, is easy of application. But the process discovered by Dr. Fuchs seems incomplete and open to some grave objections, although the principle on which it rests is sound.

Silica is soluble when fused or boiled under pressure with excess of caustic alkali. The compound thus obtained is a viscid, sticky liquid, of syrupy consistency; for many purposes it is a better adhesive material than gum, and its effect as a fixing medium is to bind colours very firmly to certain surfaces; it binds them, however, as a gum, though in some instances it fixes them by a chemical action; but this cannot be depended upon as securing the stability of a painting, as it only happens where the colours used form chemical compounds with the silicate, and this is the exception. When a soluble silicate is applied to a surface containing a substance with which it readily unites, a portion of the silica in solution will combine with it; and in proportion as the silica is precipitated the alkali which held it in solution will be set free, and therefore the remaining silicate will become more alkaline and more soluble. This is proved by exposing a piece of stone, such as Caen stone, coated with silica, to the action of the atmosphere; the silicate, which at first dried with a glossy surface, gradually dissolves, being acted upon by the moisture of the air, and that which had penetrated to a slight depth into the stone behaves in the same manner and loosens the particles on its surface.
